**Abstract:** The purpose of this paper is to introduce strongly and perfectly  $\beta g^*$  Continuous Maps, totally  $\beta g^*$  continuous functions and slightly  $\beta g^*$  continuous functions are investigated. Additionally, we relate and compare these functions with some other functions in topological spaces.

**Keywords and phrases:** strongly  $\beta g^*$  continuous functions, perfectly  $\beta g^*$  continuous functions, totally  $\beta g^*$  continuous and slightly  $\beta g^*$  continuous.

## I. Introduction

In 1960, Levine [5] introduced strong continuity in topological spaces. Also, in 1982 Malghan [6] introduced the generalized closed mappings. Recently, C. Dhanapayam and K. Indirani [3] introduced  $\beta g^*$  set in topological spaces. RC Jain [7] introduced the concept of totally continuous functions and slightly continuous for topological spaces. In this paper, we define totally  $\beta g^*$  continuous functions and slightly  $\beta g^*$  continuous functions and basic properties of these functions are investigated and obtained. In this paper we introduce and investigate a new class of functions called strongly  $\beta g^*$  continuous functions, perfectly  $\beta g^*$  continuous functions, totally  $\beta g^*$  continuous and slightly  $\beta g^*$  continuous functions are investigated and obtained.

## II. Preliminaries

Throughout this paper  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \eta)$  or  $X, Y, Z$  represent non-empty topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a space  $(X, \tau)$ ,  $\text{cl}(A)$  and  $\text{int}(A)$  denote the closure and the interior of  $A$  respectively. The power set of  $X$  is denoted by  $P(X)$ . If  $A$  is  $\beta g^*$  open and  $\beta g^*$  closed, then it is said to be  $\beta g^*$  clopen.

**Definition 2.1:** A subset  $A$  of a topological space  $X$  is said to be a  $\beta g^*$  closed [3] if  $\text{gcl}(A) \subseteq U, A \subseteq U, U$  is semi pre open ( $\beta$  open) in  $X$ .

**Definition 2.2:** A subset  $A$  of a topological space  $X$  is said to be  $\beta$  open [1] if  $A \subseteq \text{cl}(\text{int}(\text{cl}(A)))$ .

**Definition 2.3:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a **strongly continuous** [6] if  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$  for each subset  $O$  in  $(Y, \sigma)$ .

**Definition 2.4:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a  $\beta g^*$  continuous [2] if  $f^{-1}(O)$  is a  $\beta g^*$  open set of  $(X, \tau)$  for every open set  $O$  of  $(Y, \sigma)$ .

**Definition 2.5:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a **perfectly continuous** [6] if  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$  for every open set  $O$  in  $(Y, \sigma)$ .

**Definition 2.6:** A Topological space  $X$  is said to be  $\beta g^*$   $T_{1/2}$  space if every  $\beta g^*$  open set of  $X$  is open in  $X$ .

**Definition 2.7:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called **totally continuous** [4] if  $f^{-1}(V)$  is clopen set in  $X$  for each open set  $V$  of  $Y$ .

**Definition 2.8:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a **slightly continuous** [4] if the inverse image of every clopen set in  $Y$  is open in  $X$ .

**Definition 2.9:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a **contra continuous** [4] if  $f^{-1}(O)$  is closed in  $(X, \tau)$  for every open set  $O$  in  $(Y, \sigma)$ .

**Definition 2.10:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called *Contra  $\beta g^*$  continuous functions* if  $f^{-1}(O)$  is  $\beta g^*$  closed in  $(X, \tau)$  for every open set  $O$  in  $(Y, \sigma)$ .

**Definition 2.11:** A topological space  $X$  is called a  $\beta g^*$  *connected* if  $X$  cannot be expressed as a disjoint union of two non-empty  $\beta g^*$  open sets.

**Definition 2.12:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be *pre  $\beta g^*$  open* if the image of every  $\beta g^*$  open set of  $X$  is  $\beta g^*$  open in  $Y$ .

**Definition 2.13:** A topological space  $X$  is said to be *connected* if  $X$  cannot be expressed as the union of two disjoint nonempty open sets in  $X$ .

**Definition 2.14:** A Topological space  $X$  is said to be  $\beta g^*$  *T1/2 space or  $\beta g^*$  space* if every  $\beta g^*$  open set of  $X$  is open in  $X$ .

**Definition 2.15:** A space  $(X, \tau)$  is called a *locally indiscrete space* if every open set of  $X$  is closed in  $X$ .

**Theorem 2.16[3]:** Every open set is  $\beta g^*$  - open and every closed set is  $\beta g^*$  -closed set

### III. Strongly $\beta g^*$ Continuous Function

We introduce the following definition.

**Definition 3.1:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a strongly  $\beta g^*$  continuous if the inverse image of every  $\beta g^*$  open set in  $(Y, \sigma)$  is open in  $(X, \tau)$ .

**Theorem 3.2:** If a map  $f: X \rightarrow Y$  from a topological spaces  $X$  into a topological spaces  $Y$  is strongly  $\beta g^*$  continuous then it is continuous.

**Proof:** Let  $O$  be a open set in  $Y$ . Since every open set is  $\beta g^*$  open,  $O$  is  $\beta g^*$  open in  $Y$ . Since  $f$  is strongly  $\beta g^*$  continuous,  $f^{-1}(O)$  is open in  $X$ . Therefore  $f$  is continuous.

**Remark 3.3:** The following example supports that the converse of the above theorem is not true in general.

**Example 3.4:** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{b, c\}, X\}$ ,

$\sigma = \{\emptyset, \{c\}, \{a, c\}, \{b, c\}, Y\}$ .

$\beta g^* o(Y, \sigma) = \{\emptyset, \{c\}, \{a, c\}, \{b, c\}, Y\}$ .

Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = a$ ,  $g(b) = b$ ,  $g(c) = c$ .

Clearly,  $g$  is not strongly  $\beta g^*$  continuous.

Since  $\{c\}$  is  $\beta g^*$  open set in  $Y$  but  $g^{-1}(\{c\}) = \{c\}$  is not a open set of  $X$ .

Clearly,  $g$  is not strongly  $\beta g^*$  continuous.

Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = a$ ,  $g(b) = c$ ,  $g(c) = b$ .

Since  $\{a\}, \{b\}, \{a, b\}$  is closed set in  $Y$  but  $g^{-1}(\{a\}) = \{a\}$ ,  $g^{-1}(\{b\}) = \{c\}$ ,  $g^{-1}(\{a, b\}) = \{a, c\}$ , is closed subset of  $X$ .

However,  $g$  is continuous.

**Theorem 3.5:** A map  $f: X \rightarrow Y$  from a topological spaces  $X$  into a topological spaces  $Y$  is strongly  $\beta g^*$  continuous if and only if the inverse image of every  $\beta g^*$  closed set in  $Y$  is closed in  $X$ .

**Proof:** Assume that  $f$  is strongly  $\beta g^*$  continuous. Let  $O$  be any  $\beta g^*$  closed set in  $Y$ . Then  $O^c$  is  $\beta g^*$  open in  $Y$ . Since  $f$  is strongly  $\beta g^*$  continuous,  $f^{-1}(O^c)$  is open in  $X$ . But  $f^{-1}(O^c) = X / f^{-1}(O)$  and so  $f^{-1}(O)$  is closed in  $X$ .

Conversely, assume that the inverse image of every  $\beta g^*$  closed set in  $Y$  is closed in  $X$ . Then  $O^c$  is  $\beta g^*$  closed in  $Y$ . By assumption,  $f^{-1}(O^c)$  is closed in  $X$ ,

but  $f^{-1}(O^c) = X / f^{-1}(O)$  and so  $f^{-1}(O)$  is open in  $X$ . Therefore,  $f$  is strongly  $\beta g^*$  continuous.

**Theorem 3.6:** If a map  $f: X \rightarrow Y$  is strongly continuous then it is strongly  $\beta g^*$  continuous. **Proof:** Assume that  $f$  is strongly continuous. Let  $O$  be any  $\beta g^*$  open set in  $Y$ . Since  $f$  is strongly continuous,  $f^{-1}(O)$  is open in  $X$ . Therefore,  $f$  is strongly  $\beta g^*$  continuous.

**Remark 3.7:** The converse of the above theorem need not be true.

**Example 3.8:** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{ac\}, X\}$  and

$\sigma = \{\emptyset, \{a\}, \{a, c\}, \{a, b\}, Y\}$ .

$\beta g * O(Y, \sigma) = \{\emptyset, \{a\}, \{a, c\}, \{a, b\}, Y\}$ .

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a, f(b) = b, f(c) = c$ .

since  $\{a\}, \{a, c\}, \{a, b\}$  is  $\beta g *$  open set in  $Y$

But  $f^{-1}(\{a\}) = a, f^{-1}(\{a, c\}) = \{a, c\}, f^{-1}(\{a, b\}) = \{a, b\}$  is open in  $X$ ,

clearly,  $f$  is strongly  $\beta g *$  continuous.

Since  $\{a, b\}$  is subset of  $Y$ .

But  $f^{-1}(\{a, b\}) = \{a, b\}$  is open in  $X$ , not closed in  $X$ .

Therefore  $f$  is not strongly continuous.

**Theorem 3.9:** If a map  $f: X \rightarrow Y$  is strongly  $\beta g *$  continuous then it is  $\beta g *$  continuous.

**Proof:** Let  $O$  be an open set in  $Y$ . By [3]  $O$  is  $\beta g *$  open in  $Y$ . Since  $f$  is strongly  $\beta g *$  continuous  $\Rightarrow f^{-1}(O)$  is open in  $X$ . By [2]  $f^{-1}(O)$  is  $\beta g *$  open in  $X$ . Therefore,  $f$  is  $\beta g *$  continuous.

**Remark 3.10:** The converse of the above theorem need not be true.

**Example 3.11:** Let  $X = Y = \{a, b, c\}, \tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{b, c\}, X\}$  and

$\sigma = \{\emptyset, \{c\}, \{a, c\}, \{b, c\}, Y\}$ ,

$\beta g * O(Y, \sigma) = \{\emptyset, \{c\}, \{a, c\}, \{b, c\}, Y\}$ .

$\beta g * O(X, \tau) = \{\emptyset, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}, X\}$ .

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a, f(b) = b, f(c) = c$ .

Since  $\{c\}, \{a, c\}, \{b, c\}$  is open set in  $Y$

But  $f^{-1}(\{c\}) = c, f^{-1}(\{a, c\}) = \{a, c\}, f^{-1}(\{b, c\}) = \{b, c\}$  is  $\beta g *$  open set in  $X$ ,

Clearly,  $f$  is  $\beta g *$  continuous.

Since  $\{c\}$  is  $\beta g * O(Y, \sigma)$

But  $f^{-1}(\{c\}) = \{c\}$  is not open in  $X$ .

Therefore  $f$  is not strongly  $\beta g *$  continuous.

**Theorem 3.12:** If a map  $f: X \rightarrow Y$  is strongly  $\beta g *$  continuous and a map  $g: Y \rightarrow Z$  is  $\beta g *$  continuous then  $g \circ f: X \rightarrow Z$  is continuous.

**Proof:** Let  $O$  be any open set in  $Z$ . Since  $g$  is  $\beta g *$  continuous,  $g^{-1}(O)$  is  $\beta g *$  open in  $Y$ . Since  $f$  is strongly  $\beta g *$  continuous  $f^{-1}(g^{-1}(O))$  is open in  $X$ . But  $(g \circ f)^{-1}(O) = f^{-1}(g^{-1}(O))$ .

Therefore,  $g \circ f$  is continuous.

**Theorem 3.13:** If a map  $f: X \rightarrow Y$  is strongly  $\beta g *$  continuous and a map  $g: Y \rightarrow Z$  is  $\beta g *$  irresolute, then  $g \circ f: X \rightarrow Z$  is strongly  $\beta g *$  continuous.

**Proof:** Let  $O$  be any  $\beta g *$  open set in  $Z$ . Since  $g$  is  $\beta g *$  irresolute,  $g^{-1}(O)$  is  $\beta g *$  open in  $Y$ . Also,  $f$  is strongly  $\beta g *$  continuous  $f^{-1}(g^{-1}(O))$  is open in  $X$ . But  $(g \circ f)^{-1}(O) = f^{-1}(g^{-1}(O))$  is open in  $X$ . Hence,  $g \circ f: X \rightarrow Z$  is strongly  $\beta g *$  continuous.

**Theorem 3.14:** If a map  $f: X \rightarrow Y$  is  $\beta g *$  continuous and a map  $g: Y \rightarrow Z$  is strongly  $\beta g *$  continuous, then  $g \circ f: X \rightarrow Z$  is  $\beta g *$  irresolute.

**Proof:** Let  $O$  be any  $\beta g *$  open set in  $Z$ . Since  $g$  is strongly  $\beta g *$  continuous,  $g^{-1}(O)$  is open in  $Y$ . Also,  $f$  is  $\beta g *$  continuous,  $f^{-1}(g^{-1}(O))$  is  $\beta g *$  open in  $X$ . But  $(g \circ f)^{-1}(O) = f^{-1}(g^{-1}(O))$ .

Hence,  $g \circ f: X \rightarrow Z$  is  $\beta g *$  irresolute.

**Theorem 3.15:** Let  $X$  be any topological spaces and  $Y$  be a  $\beta g * T_{1/2}$  space and  $f: X \rightarrow Y$  be a map. Then the following are equivalent

- 1)  $f$  is strongly  $\beta g *$  continuous
- 2)  $f$  is continuous

**Proof:** (1)  $\Rightarrow$  (2) Let  $O$  be any open set in  $Y$ . By [3]  $O$  is  $\beta g *$  open in  $Y$ . Then  $f^{-1}(O)$  is open in  $X$ . Hence,  $f$  is continuous.

(2)  $\Rightarrow$  (1) Let  $O$  be any  $\beta g *$  open in  $(Y, \sigma)$ . Since,  $(Y, \sigma)$  is a  $\beta g * T_{1/2}$  space,  $O$  is open in  $(Y, \sigma)$ . Since,  $f$  is continuous. Then  $f^{-1}(O)$  is open in  $(X, \tau)$ . Hence,  $f$  is strongly  $\beta g *$  continuous.

**Theorem 3.16:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a map. Both  $(X, \tau)$  and  $(Y, \sigma)$  are  $\beta g * T_{1/2}$  space. Then the following are equivalent.

- 1)  $f$  is  $\beta g *$  irresolute

2)  $f$  is strongly  $\beta g^*$  continuous

3)  $f$  is continuous

4)  $f$  is  $\beta g^*$  continuous

**Proof:** The proof is obvious.

**Theorem 3.17:** The composition of two strongly  $\beta g^*$  continuous maps is strongly  $\beta g^*$  continuous.

**Proof:** Let  $O$  be a  $\beta g^*$  open set in  $(Z, \eta)$ . Since,  $g$  is strongly  $\beta g^*$  continuous, we get  $g^{-1}(O)$  is open in  $(Y, \sigma)$ . By [3]  $g^{-1}(O)$  is  $\beta g^*$  open in  $(Y, \sigma)$ . As  $f$  is also strongly  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O)) = (g \circ f)^{-1}(O)$  is open in  $(X, \tau)$ . Hence,  $(g \circ f)$  is strongly  $\beta g^*$  continuous.

**Theorem 3.18:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be any two maps. Then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is strongly  $\beta g^*$  continuous if  $g$  is strongly  $\beta g^*$  continuous and  $f$  is continuous.

**Proof:** Let  $O$  be a  $\beta g^*$  open set in  $(Z, \eta)$ . Since,  $g$  is strongly  $\beta g^*$  continuous,  $g^{-1}(O)$  is open in  $(Y, \sigma)$ . Since  $f$  is continuous,  $f^{-1}(g^{-1}(O)) = (g \circ f)^{-1}(O)$  is open in  $(X, \tau)$ . Hence,  $(g \circ f)$  is strongly  $\beta g^*$  continuous.

#### IV. Perfectly $\beta g^*$ Continuous Function

**Definition 4.1:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be perfectly  $\beta g^*$  continuous if the inverse image of every  $\beta g^*$  open set in  $(Y, \sigma)$  is both open and closed in  $(X, \tau)$ .

**Theorem 4.2:** If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  from a topological space  $(X, \tau)$  into a topological space  $(Y, \sigma)$  is perfectly  $\beta g^*$  continuous then it is strongly  $\beta g^*$  continuous.

**Proof:** Assume that  $f$  is perfectly  $\beta g^*$  continuous. Let  $O$  be any  $\beta g^*$  open set in  $(Y, \sigma)$ . Since,  $f$  is perfectly  $\beta g^*$  continuous,  $f^{-1}(O)$  is open in  $(X, \tau)$ . Therefore,  $f$  is strongly  $\beta g^*$  continuous.

**Remark 4.3:** The converse of the above theorem need not be true.

**Example 4.4:** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$  and

$\sigma = \{\emptyset, \{a\}, \{a, b\}, \{a, c\}, Y\}$ .

$\beta g^* O(Y, \sigma) = \{\emptyset, \{a\}, \{a, b\}, \{a, c\}, Y\}$ .

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$ .

since  $\{a\}$ ,  $\{a, b\}$ ,  $\{a, c\}$  is  $\beta g^*$  open set in  $Y$

But  $f^{-1}(\{a\}) = \{a\}$ ,  $f^{-1}(\{a, b\}) = \{a, b\}$ ,  $f^{-1}(\{a, c\}) = \{a, c\}$  is open set in  $X$ ,

clearly,  $f$  is strongly  $\beta g^*$  continuous.

Since  $\{a\}$  is  $\beta g^*$  open set in  $(Y, \sigma)$

But  $f^{-1}(\{a\}) = \{a\}$  is open in  $X$ , but not closed in  $X$ .

Therefore  $f$  is not perfectly  $\beta g^*$  continuous.

**Theorem 4.5:** If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  from a topological space  $(X, \tau)$  into a topological space  $(Y, \sigma)$  is perfectly  $\beta g^*$  continuous then it is perfectly continuous.

**Proof:** Let  $O$  be an open set in  $Y$ . By [3]  $O$  is a  $\beta g^*$  open set in  $(Y, \sigma)$ . Since  $f$  is perfectly  $\beta g^*$  continuous,  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$ . Therefore,  $f$  is perfectly continuous.

**Remark 4.6 :** The converse of the above theorem need not be true.

**Example 4.7:** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{a, c\}, \{a, b\}, X\}$  and

$\sigma = \{\emptyset, \{b\}, Y\}$ .

$\beta g^* O(Y, \sigma) = \{\emptyset, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}, Y\}$ .

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$ .

Since  $\{b\}$  is open set in  $(Y, \sigma)$

$f^{-1}(\{b\}) = \{b\}$  is both open and closed in  $X$ .

clearly,  $f$  is perfectly continuous.

Since  $\{a\}$  is  $\beta g^*$  open set in  $(Y, \sigma)$

$f^{-1}(\{a\}) = \{a\}$  is open and not closed in  $X$ .

Therefore  $f$  is not perfectly  $\beta g^*$  continuous.

**Theorem 4.8:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  from a topological space  $(X, \tau)$  into a topological space  $(Y, \sigma)$  is perfectly  $\beta g^*$  continuous if and only if  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$  for every  $\beta g^*$  closed set  $O$  in  $(Y, \sigma)$ .

**Proof:** Let  $O$  be any  $\beta g^*$  closed set in  $(Y, \sigma)$ . Then  $O^c$  is  $\beta g^*$  open in  $(Y, \sigma)$ . Since,  $f$  is perfectly  $\beta g^*$  continuous,  $f^{-1}(O^c)$  is both open and closed in  $(X, \tau)$ . But  $f^{-1}(O^c) = X/f^{-1}(O)$  and so  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$ .

Conversely, assume that the inverse image of every  $\beta g^*$  closed set in  $(Y, \sigma)$  is both open and closed in  $(X, \tau)$ . Let  $O$  be any  $\beta g^*$  open in  $(Y, \sigma)$ . Then  $O^c$  is  $\beta g^*$  closed in  $(Y, \sigma)$ . By assumption  $f^{-1}(O^c)$  is both open and closed in  $(X, \tau)$ . But  $f^{-1}(O^c) = X/f^{-1}(O)$  and so  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$ . Therefore,  $f$  is perfectly  $\beta g^*$  continuous.

**Theorem 4.9:** Let  $(X, \tau)$  be a discrete topological space and  $(Y, \sigma)$  be any topological space. Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a map, then the following statements are true.

1)  $f$  is strongly  $\beta g^*$  continuous

2)  $f$  is perfectly  $\beta g^*$  continuous

**Proof:** (1)  $\Rightarrow$  (2) Let  $O$  be any  $\beta g^*$  open set in  $(Y, \sigma)$ . By hypothesis,  $f^{-1}(O)$  is open in  $(X, \tau)$ . Since  $(X, \tau)$  is a discrete space,  $f^{-1}(O)$  is closed in  $(X, \tau)$ .  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$ . Hence,  $f$  is perfectly  $\beta g^*$  continuous.

(2)  $\Rightarrow$  (1) Let  $O$  be any  $\beta g^*$  open set in  $(Y, \sigma)$ . Then,  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$ . Hence,  $f$  is strongly  $\beta g^*$  continuous.

**Theorem 4.10:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  are perfectly  $\beta g^*$  continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is also perfectly  $\beta g^*$  continuous.

**Proof:** Let  $O$  be a  $\beta g^*$  open set in  $(Z, \eta)$ . Since,  $g$  is perfectly  $\beta g^*$  continuous.

We get that  $g^{-1}(O)$  is open and closed in  $(Y, \sigma)$ . By thm [ ]  $g^{-1}(O)$  is  $\beta g^*$  open in  $(Y, \sigma)$ .

Since  $f$  is perfectly  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O)) = (g \circ f)^{-1}(O)$  is both open and closed in  $(X, \tau)$ . Hence,  $g \circ f$  is perfectly  $\beta g^*$  continuous.

**Theorem 4.11:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be any two maps. Then their composition is strongly  $\beta g^*$  continuous if  $g$  is perfectly  $\beta g^*$  continuous and  $f$  is continuous.

**Proof:** Let  $O$  be any  $\beta g^*$  open set in  $(Z, \eta)$ . Then,  $g^{-1}(O)$  is open and closed in  $(Y, \sigma)$ .

Since,  $f$  is continuous.  $f^{-1}(g^{-1}(O)) = (g \circ f)^{-1}(O)$  is open in  $(X, \tau)$ .

Hence,  $g \circ f$  is strongly  $\beta g^*$  continuous.

**Theorem 4.12:** If a map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is perfectly  $\beta g^*$  continuous and a map  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is strongly  $\beta g^*$  continuous then the composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is perfectly  $\beta g^*$  continuous.

**Proof:** Let  $O$  be any  $\beta g^*$  open set in  $(Z, \eta)$ . Then,  $g^{-1}(O)$  is open in  $(Y, \sigma)$ . By thm [ ]  $g^{-1}(O)$  is  $\beta g^*$  open in  $(Y, \sigma)$ . By hypothesis,  $f^{-1}(g^{-1}(O)) = (g \circ f)^{-1}(O)$  is both open and closed in  $(X, \tau)$ . Therefore,  $g \circ f$  is perfectly  $\beta g^*$  continuous.

### V. Totally $\beta g^*$ continuous functions

**Definition 5.1:** A function  $(X, \tau) \rightarrow (Y, \sigma)$  is called **totally  $\beta g^*$  continuous functions** if the inverse image of every open set of  $(Y, \sigma)$  is both  $\beta g^*$  open and  $\beta g^*$  closed subset of  $(X, \tau)$ .

**Example 5.2:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{c\}, \{d\}, \{c, d\}, X\}$ ,  $\sigma = \{\emptyset, \{b\}, \{a, b\}, \{b, c\}, \{a, b, c\}, Y\}$ ,  $\beta g^* O(X, \tau) = \{\emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$  and  $\beta g^* C(X, \tau) = \{\emptyset, \{a\}, \{b\}, \{a, c\}, \{a, b\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ . Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = b$ ,  $g(b) = d$ ,  $g(c) = a$ ,  $g(d) = c$ . Therefore,  $g^{-1}(\{b\}) = \{a\}$ ,  $g^{-1}(\{a, b\}) = \{c, a\}$ ,  $g^{-1}(\{b, c\}) = \{d, a\}$ ,  $g^{-1}(\{a, b, c\}) = \{c, a, d\}$ .

$f^{-1}(\{b, c\}) = \{a, d\}$ ,  $g^{-1}(\{a, b, c\}) = \{a, c, d\}$ . Hence the inverse image of every open set of  $(Y, \sigma)$  is both  $\beta g^*$  open and  $\beta g^*$  closed subset of  $(X, \tau)$ . Therefore,  $g$  is totally  $\beta g^*$  continuous.

**Theorem 5.3:** Every totally  $\beta g^*$  continuous functions is  $\beta g^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be totally  $\beta g^*$  continuous and  $O$  be an open set of  $(Y, \sigma)$ . Since,  $f$  is totally  $\beta g^*$  continuous functions,  $f^{-1}(O)$  is both  $\beta g^*$  open and  $\beta g^*$  closed in  $(X, \tau)$ . Therefore,  $f$  is  $\beta g^*$  continuous.

**Remark 5.4:** The converse of above theorem need not be true.

**Example 5.5:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\phi, \{c\}, \{d\}, \{c, d\}, X\}$ ,  $\sigma = \{\phi, \{a\}, \{b\}, \{a, b\}, Y\}$ .

$\beta g^* O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$  and  $\beta g^* C(X, \tau) = \{\phi, \{a\}, \{b\}, \{a, c\}, \{a, b\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ .

Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = a$ ,  $g(b) = c$ ,  $g(c) = b$ ,  $g(d) = d$ .

Clearly,  $g$  is not totally  $\beta g^*$  continuous since  $g^{-1}(\{b\}) = \{c\}$  is  $\beta g^*$  open in  $X$  but not  $\beta g^*$  closed.

However,  $g$  is  $\beta g^*$  continuous.

**Theorem 5.6:** Every totally continuous function is totally  $\beta g^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be the totally  $\beta g^*$  continuous and  $O$  be an open set of  $(Y, \sigma)$ . Since,  $f$  is totally continuous functions,  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$ .

Since every open set is  $\beta g^*$  open and every closed set is  $\beta g^*$  closed.  $f^{-1}(O)$  is both  $\beta g^*$  open and  $\beta g^*$  closed in  $(X, \tau)$ . Therefore,  $f$  is totally  $\beta g^*$  continuous.

**Remark 5.7:** The converse of above theorem need not be true.

**Example 5.8:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\phi, \{c\}, \{d\}, \{c, d\}, X\}$ ,

$\tau^c = \{\phi, \{a, b, d\}, \{a, b, c\}, \{a, b\}, X\}$ ,  $\sigma = \{\phi, \{b\}, \{b, d\}, Y\}$ .

$\beta g^* O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$  and  $\beta g^* C(X, \tau) = \{\phi, \{a\}, \{b\}, \{a, c\}, \{a, b\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = c$ ,  $f(b) = b$ ,  $f(c) = a$ ,  $f(d) = d$ , since,  $f^{-1}(\{b\}) = \{b\}$ ,  $f^{-1}(\{b, d\}) = \{b, d\}$  is both  $\beta g^*$  open and  $\beta g^*$  closed in  $X$ .

Clearly,  $f$  is totally  $\beta g^*$  continuous.

But  $f$  is not totally continuous as the inverse image of the open set  $\{b\}$  of  $(Y, \sigma)$  is not a clopen set in  $(X, \tau)$ , and hence  $\beta g^*$  continuous.

**Theorem 5.9:** Every perfectly  $\beta g^*$  continuous map is totally  $\beta g^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a perfectly  $\beta g^*$  continuous map.

Let  $O$  be an open set of  $(Y, \sigma)$ . Then  $O$  is  $\beta g^*$  open in  $(Y, \sigma)$ .

Since  $f$  is perfectly  $\beta g^*$  continuous,  $f^{-1}(O)$  is both open and closed in  $(X, \tau)$ , implies  $f^{-1}(O)$  is both  $\beta g^*$  open and  $\beta g^*$  closed in  $(X, \tau)$ .

Therefore,  $f$  is totally  $\beta g^*$  continuous.

**Remark 5.10:** The converse of above theorem need not be true.

**Example 5.11:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\phi, \{c\}, \{d\}, \{c, d\}, X\}$ ,

$\tau^c = \{\phi, \{a, b, d\}, \{a, b, c\}, \{a, b\}, X\}$ ,  $\sigma = \{\phi, \{b\}, \{a, c, d\}, Y\}$ .

Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = a$ ,  $g(b) = b$ ,  $g(c) = c$ ,  $g(d) = d$ .

$\beta g^* O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$  and  $\beta g^* C(X, \tau) = \{\phi, \{a\}, \{b\}, \{a, c\}, \{a, b\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ . since,  $g^{-1}(\{b\}) = \{b\}$ ,  $g^{-1}(\{a, c, d\}) = \{a, c, d\}$  is both  $\beta g^*$  open and  $\beta g^*$  closed in  $X$ . Clearly,  $g$  is totally  $\beta g^*$  continuous.

$\beta g^* O(Y, \sigma) = \{\phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{b, c, d\}, Y\}$ .

But  $g^{-1}(\{c, d\}) = \{c, d\}$  is open in  $X$  but not closed in  $X$ .

Therefore,  $g$  is not perfectly  $\beta g^*$  continuous.

**Remark 5.12:** The concept of totally  $\beta g^*$  continuous and strongly  $\beta g^*$  continuous are independent of each other.

**Example 5.13:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\phi, \{c\}, \{d\}, \{c, d\}, X\}$ ,

$\tau^c = \{\phi, \{a, b, d\}, \{a, b, c\}, \{a, b\}, X\}$ ,  $\sigma = \{\phi, \{b\}, \{a, c, d\}, Y\}$ .

Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = a$ ,  $g(b) = b$ ,  $g(c) = c$ ,  $g(d) = d$ .

$\beta g^* O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$  and  $\beta g^* C(X, \tau) = \{\phi, \{a\}, \{b\}, \{a, c\}, \{a, b\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ . Since,  $g^{-1}(\{b\}) = \{b\}$ ,  $g^{-1}(\{a, c, d\}) = \{a, c, d\}$  is both  $\beta g^*$  open and  $\beta g^*$  closed in  $X$ . Clearly,  $g$  is totally  $\beta g^*$  continuous.  $\beta g^* O(Y, \sigma) = \{\phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{b, c, d\}, Y\}$ . Clearly,  $g$  is totally  $\beta g^*$  continuous but  $g^{-1}(\{a, b, c\}) = \{a, b, c\}$  is not open in  $X$ . Therefore,  $g$  is not strongly  $\beta g^*$  continuous.

**Theorem 5.14:** If  $f: X \rightarrow Y$  is a totally  $\beta g^*$  continuous map, and  $X$  is  $\beta g^*$  connected, then  $Y$  is an indiscrete space.

**Proof:** Suppose that  $Y$  is not an indiscrete space.

Let  $A$  be a non-empty open subset of  $Y$ .

Since,  $f$  is totally  $\beta g^*$  continuous map, then  $f^{-1}(A)$  is a non-empty  $\beta g^*$  clopen subset of  $X$ .

Then  $X = f^{-1}(A) \cup (f^{-1}(A))^c$ .

Thus,  $X$  is a union of two non-empty disjoint  $\beta g^*$  open sets which is contradiction to the fact that  $X$  is  $\beta g^*$  connected.

Therefore,  $Y$  must be an indiscrete space

**Theorem 5.15:** Let  $f: X \rightarrow Y$  and  $g: Y \rightarrow Z$  be functions. Then  $g \circ f: X \rightarrow Z$

(i) If  $f$  is  $\beta g^*$  irresolute and  $g$  is totally  $\beta g^*$  continuous then  $g \circ f$  is totally  $\beta g^*$  continuous

(ii) If  $f$  is totally  $\beta g^*$  continuous and  $g$  is continuous then  $g \circ f$  is totally  $\beta g^*$  continuous.

**Proof:**

(i) Let  $O$  be an open set in  $Z$ . Since  $g$  is totally  $\beta g^*$  continuous,  $g^{-1}(O)$  is  $\beta g^*$  clopen in  $Y$ .

Since  $f$  is  $\beta g^*$  irresolute,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open and  $\beta g^*$  closed in  $X$ .

Since,  $(g \circ f)^{-1}(O) = f^{-1}(g^{-1}(O))$ . Therefore,  $g \circ f$  is totally  $\beta g^*$  continuous.

(ii) Let  $O$  be an open set in  $Z$ . Since  $g$  is continuous,  $g^{-1}(O)$  is open in  $Y$ .

Since,  $f$  is totally  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  clopen in  $X$ . Hence,  $g \circ f$  is totally  $\beta g^*$  continuous.

## VI. Slightly $\beta g^*$ continuous functions

**Definition 6.1:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called slightly  $\beta g^*$  continuous at a point  $x \in X$  if for each clopen subset  $V$  of  $Y$  containing  $f(x)$ , there exists a  $\beta g^*$  open subset  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq V$ .

The function  $f$  is said to be slightly  $\beta g^*$  continuous if  $f$  is slightly  $\beta g^*$  continuous at each of its points.

**Definition 6.2:** A function  $(X, \tau) \rightarrow (Y, \sigma)$  is said to be **slightly  $\beta g^*$  continuous** if the inverse image of every clopen set in  $Y$  is  $\beta g^*$  open in  $X$

**Example 6.3:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\phi, \{c\}, \{d\}, \{c, d\}, X\}$ ,

$\sigma = \sigma^c = \{\phi, \{a, d\}, \{b, c\}, Y\}$ .

$\beta g^* O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$

Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = b$ ,  $g(b) = a$ ,  $g(c) = c$ ,  $g(d) = d$ .

since,  $g^{-1}(\{a, d\}) = \{b, d\}$ ,  $g^{-1}(\{b, c\}) = \{a, c\}$  is  $\beta g^*$  open in  $X$ .

Therefore,  $g$  is **slightly  $\beta g^*$  continuous**.

**Proposition 6.4:** The definitions 6.1 and 4.6 are equivalent.

**Proof:** Suppose the definition 6.1 holds. Let  $O$  be a clopen set in  $Y$  and  $x \in f^{-1}(O)$ .

Then  $f(x) \in O$  and thus there exists a  $\beta g^*$  open set  $U$  such that  $x \in U$  and  $f(U) \subseteq O$  and

$f^{-1}(O) = \cup \{x \in f^{-1}(O) \mid x \in U\}$ .

Since, arbitrary union of  $\beta g^*$  open set is  $\beta g^*$  open.

$f^{-1}(O)$  is  $\beta g^*$  open in  $X$ .

Therefore,  $f$  is slightly  $\beta g^*$  continuous.

Suppose the definition 6.2 holds.

Let  $f(x) \in O$  where,  $O$  is a clopen set in  $Y$ . Since,  $f$  is slightly  $\beta g^*$  continuous  $f^{-1}(O)$  is  $\beta g^*$  open in  $X$ ,  $x \in f^{-1}(O)$

Let  $U = f^{-1}(O)$ . Then  $U$  is  $\beta g^*$  open in  $X$ ,  $x \in U$ , and  $f(U) \subseteq O$ .

**Theorem 6.5:** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent.

(i)  $f$  is slightly  $\beta g^*$  continuous.

(ii) The inverse image of every clopen set  $O$  of  $Y$  is  $\beta g^*$  open in  $X$ .

(iii) The inverse image of every clopen set  $O$  of  $Y$  is  $\beta g^*$  closed in  $X$ .

(iv) The inverse image of every clopen set  $O$  of  $Y$  is  $\beta g^*$  clopen in  $X$ .

**Proof:**

(i)  $\Rightarrow$  (ii): Follows from the proposition 6.4

(ii)  $\Rightarrow$  (iii): Let  $O$  be a clopen set in  $Y$  which implies  $O^c$  is clopen in  $Y$ .

By (ii),  $f^{-1}(O^c) = (f^{-1}(O))^c$  is  $\beta g^*$  open in  $X$ .

Therefore,  $f^{-1}(O)$  is  $\beta g^*$  closed in  $X$ .

(iii)  $\Rightarrow$  (iv): By (ii) and (iii),  $f^{-1}(O)$  is  $\beta g^*$  clopen in  $X$ .

(iv)  $\Rightarrow$  (i): Let  $O$  be a clopen set in  $Y$  containing  $f(x)$ , by (iv)  $f^{-1}(O)$  is  $\beta g^*$  clopen in  $X$ .

Take  $U = f^{-1}(O)$ , then  $f(U) \subseteq O$ .

Hence,  $f$  is slightly  $\beta g^*$  continuous.

**Theorem 6.6:** Every slightly continuous function is slightly  $\beta g^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a slightly continuous function.

Let  $O$  be a clopen set in  $Y$ .

Then,  $f^{-1}(O)$  is open in  $X$ . Since, every open set is  $\beta g^*$  open.

Hence,  $f$  is slightly  $\beta g^*$  continuous.

**Remark 6.7:** The converse of the above theorem need not be true as can be seen from the following example.

**Example 6.8:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{c\}, \{d\}, \{c, d\}, X\}$ ,  $\sigma = \sigma^c = \{\emptyset, \{a, d\}, \{b, c\}, Y\}$ .

$\beta g^* O(X, \tau) = \{\emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$

Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = b$ ,  $g(b) = a$ ,  $g(c) = c$ ,  $g(d) = d$ .

since,  $g^{-1}(\{a, d\}) = \{b, d\}$ ,  $g^{-1}(\{b, c\}) = \{a, c\}$  is  $\beta g^*$  open in  $X$ .

Clearly,  $g$  is slightly  $\beta g^*$  continuous.

But not slightly continuous.

Since,  $g^{-1}(a, d) = \{b, d\}$  where  $\{a, d\}$  is clopen in  $Y$  but  $\{b, d\}$  is not open in  $X$ .

**Theorem 6.9:** Every  $\beta g^*$  continuous function is slightly  $\beta g^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  $\beta g^*$  continuous function.

Let  $O$  be a clopen set in  $Y$ .

Then,  $f^{-1}(O)$  is  $\beta g^*$  open in  $X$  and  $\beta g^*$  closed in  $X$ .

Hence,  $f$  is slightly  $\beta g^*$  continuous.

**Remark 6.10:** The converse of the above theorem need not be true as can be seen from the following example.

**Example 6.11:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{c\}, \{d\}, \{c, d\}, X\}$ ,  $\sigma = \sigma^c = \{\emptyset, \{a, d\}, \{b, c\}, Y\}$ ,  $\beta g^* O(X,$

$\tau) = \{\emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$  Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be

defined by  $f(a) = b$ ,  $f(b) = a$ ,  $f(c) = c$ ,  $f(d) = d$

since,  $f^{-1}(\{a, d\}) = \{b, d\}$ ,  $f^{-1}(\{b, c\}) = \{a, c\}$  is  $\beta g^*$  open in  $X$ .

The function  $f$  is slightly  $\beta g^*$  continuous. Let  $g: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $g(a) = a$ ,  $g(b) = d$ ,  $g(c) = c$ ,

$g(d) = b$  But not  $\beta g^*$  continuous, since,  $g^{-1}(a, d) = \{a, b\}$  is not  $\beta g^*$  open in  $X$ .

**Theorem 6.12:** Every contra  $\beta g^*$  continuous function is slightly  $\beta g^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a contra  $\beta g^*$  continuous function.

Let  $O$  be a clopen set in  $Y$ .

$f^{-1}(O)$  is  $\beta g^*$  open in  $X$  as  $f$  is contra  $\beta g^*$  continuous.

Hence,  $f$  is slightly  $\beta g^*$  continuous.

**Remark 6.13:** The converse of the above theorem need not be true as can be seen from the following example.

**Example 6.14:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\phi, \{c\}, \{d\}, \{c, d\}, X\}$ ,  $\tau^c = \{\phi, \{a, b, d\}, \{a, b, c\}, \{a, b\}, X\}$ ,  
 $\sigma = \sigma^c = \{\phi, \{a, d\}, \{b, c\}, Y\}$ .

$\beta g^* O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{b, c, d\}, \{a, c, d\}, X\}$   
 $\beta g^* C(X, \tau) = \{\phi, \{a\}, \{b\}, \{a, c\}, \{a, b\}, \{a, d\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, \{b, c, d\}, X\}$ .

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = b$ ,  $f(b) = a$ ,  $f(c) = c$ ,  $f(d) = d$

since,  $f^{-1}(\{a, d\}) = \{b, d\}$ ,  $f^{-1}(\{b, c\}) = \{a, c\}$  is  $\beta g^*$  open in  $X$ .

The function  $f$  is slightly  $\beta g^*$  continuous.

**Remark 6.15:** Composition of two slightly  $\beta g^*$  continuous need not be slightly  $\beta g^*$  continuous as it can be seen from the following example.

**Example 6.16:** Let  $X=Y=\{a,b,c,d\}$ ,  $Z = \{a,b,c\}$  and the topologies are

$\tau = \{\phi, \{c\}, \{d\}, \{c, d\}, X\}$  and  $\sigma = \{\phi, \{a, d\}, \{b, c\}, Y\}$  and  $\eta = \{\phi, \{a, b\}, \{c, d\}, Z\}$ .

Define  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b$ ,  $f(b) = a$ ,  $f(c) = c$ ,  $f(d) = d$ ,

$\beta g^* O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{a, c, d\}, \{b, c, d\}, X\}$  since  $f^{-1}(a, d) = (b, d)$ ,  $f^{-1}(b, c) = (a, c)$  is  $\beta g^*$  open in  $X$ .

Clearly,  $f$  is slightly  $\beta g^*$  continuous. Define  $g: (Y, \sigma) \rightarrow (Z, \eta)$  by  $g(a) = a$ ,  $g(b) = b$ ,  $g(c) = d$ ,  $g(d) = c$ ,

$\beta g^* O(Y, \sigma) = \{\phi, \{a\}, \{b\}, \{c\}, \{d\}, \{a, b\}, \{a, c\}, \{a, d\}, \{b, c\}, \{b, d\}, \{c, d\}, \{a, b, c\}, \{a, c, d\}, \{b, c, d\}, \{a, b, d\}, Y\}$ . since  $g^{-1}(a, b) = (a, b)$ ,  $g^{-1}(c, d) = (c, d)$  is  $\beta g^*$  open in  $Y$ . Clearly,  $g$  is slightly  $\beta g^*$  continuous.

But  $(g \circ f): (X, \tau) \rightarrow (Z, \eta)$  is not slightly  $\beta g^*$  continuous,

since  $(g \circ f)^{-1}(\{a, b\}) = f^{-1}(g^{-1}\{a, b\}) = f^{-1}(\{a, b\}) = \{a, b\}$  is not a  $\beta g^*$  open in  $(X, \tau)$ .

**Theorem 6.17:** Let  $f: X \rightarrow Y$  and  $g: Y \rightarrow Z$  be functions. Then the following properties hold:

- (i) If  $f$  is  $\beta g^*$  irresolute and  $g$  is slightly  $\beta g^*$  continuous then  $(g \circ f)$  is slightly  $\beta g^*$  continuous.
- (ii) If  $f$  is  $\beta g^*$  irresolute and  $g$  is  $\beta g^*$  continuous then  $(g \circ f)$  is slightly  $\beta g^*$  continuous.
- (iii) If  $f$  is  $\beta g^*$  irresolute and  $g$  is slightly continuous then  $(g \circ f)$  is slightly  $\beta g^*$  continuous.
- (iv) If  $f$  is  $\beta g^*$  continuous and  $g$  is slightly continuous then  $(g \circ f)$  is slightly  $\beta g^*$  continuous.
- (v) If  $f$  is strongly  $\beta g^*$  continuous and  $g$  is slightly  $\beta g^*$  continuous then  $(g \circ f)$  is slightly continuous.
- (vi) If  $f$  is slightly  $\beta g^*$  continuous and  $g$  is perfectly  $\beta g^*$  continuous then  $(g \circ f)$  is  $\beta g^*$  irresolute.
- (vii) If  $f$  is slightly  $\beta g^*$  continuous and  $g$  is contra continuous then  $(g \circ f)$  is slightly  $\beta g^*$  continuous.
- (viii) If  $f$  is  $\beta g^*$  irresolute and  $g$  is contra  $\beta g^*$  continuous then  $(g \circ f)$  is slightly  $\beta g^*$  continuous.

**Proof:**

(i) Let  $O$  be a clopen set in  $Z$ . Since,  $g$  is slightly  $\beta g^*$  continuous,  $g^{-1}(O)$  is  $\beta g^*$  open in  $Y$ .

Since,  $f$  is  $\beta g^*$  irresolute,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Since,  $(g \circ f)^{-1}(O) = f^{-1}(g^{-1}(O))$ ,  $g \circ f$  is slightly  $\beta g^*$  continuous.

(ii) Let  $O$  be a clopen set in  $Z$ . Since,  $g$  is  $\beta g^*$  continuous,  $g^{-1}(O)$  is  $\beta g^*$  open in  $Y$ .

Since,  $f$  is  $\beta g^*$  irresolute,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Hence,  $g \circ f$  is slightly  $\beta g^*$  continuous.

(iii) Let  $O$  be a clopen set in  $Z$ .

Since,  $g$  is slightly continuous,  $g^{-1}(O)$  is open in  $Y$ .

Since,  $f$  is  $\beta g^*$  irresolute,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Hence,  $g \circ f$  is slightly  $\beta g^*$  continuous.

(iv) Let  $O$  be a clopen set in  $Z$ .

Since,  $g$  is slightly continuous,  $g^{-1}(O)$  is open in  $Y$ .

Since,  $f$  is  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Hence,  $g \circ f$  is slightly  $\beta g^*$  continuous.

(v) Let  $O$  be a clopen set in  $Z$ . Since,  $g$  is slightly  $\beta g^*$  continuous,  $g^{-1}(O)$  is  $\beta g^*$  open in  $Y$ .

Since,  $f$  is strongly  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O))$  is open in  $X$ .

Therefore,  $g \circ f$  is slightly continuous.

(vi) Let  $O$  be a  $\beta g^*$  open in  $Z$ .

Since,  $g$  is perfectly  $\beta g^*$  continuous,  $g^{-1}(O)$  is open and closed in  $Y$ .

Since,  $f$  is slightly  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Hence,  $g \circ f$  is  $\beta g^*$  irresolute.

(vii) Let  $O$  be a clopen set in  $Z$ .

Since,  $g$  is contra continuous,  $g^{-1}(O)$  is open and closed in  $Y$ .

Since,  $f$  is slightly  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Hence,  $g \circ f$  is slightly  $\beta g^*$  continuous.

(viii) Let  $O$  be a clopen set in  $Z$ .

Since,  $g$  is contra  $\beta g^*$  continuous,  $g^{-1}(O)$  is  $\beta g^*$  open and  $\beta g^*$  closed in  $Y$ .

Since,  $f$  is  $\beta g^*$  irresolute,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open and  $\beta g^*$  closed in  $X$ .

Hence,  $g \circ f$  is slightly  $\beta g^*$  continuous.

**Theorem 6.18:** If the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is slightly  $\beta g^*$  continuous and  $(X, \tau)$  is  $\beta g^* T_{1/2}$  space, then  $f$  is slightly continuous.

**Proof:** Let  $O$  be a clopen set in  $Y$ . Since,  $f$  is slightly  $\beta g^*$  continuous,  $f^{-1}(O)$  is  $\beta g^*$  open in  $X$ . Since,  $X$  is  $\beta g^* T_{1/2}$  space,  $f^{-1}(O)$  is open in  $X$ . Hence,  $f$  is slightly continuous.

**Theorem 6.19:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be functions. If  $f$  is surjective and pre  $\beta g^*$  open and  $(g \circ f): (X, \tau) \rightarrow (Z, \eta)$  is slightly  $\beta g^*$  continuous, then  $g$  is slightly  $\beta g^*$  continuous.

**Proof:** Let  $O$  be a clopen set in  $(Z, \eta)$ .

Since,  $(g \circ f): (X, \tau) \rightarrow (Z, \eta)$  is slightly  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Since,  $f$  is surjective and pre  $\beta g^*$  open  $f(f^{-1}(g^{-1}(O))) = g^{-1}(O)$  is  $\beta g^*$  open in  $Y$ .

Hence,  $g$  is slightly  $\beta g^*$  continuous.

**Theorem 6.20:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be functions.

If  $f$  is surjective, pre  $\beta g^*$  open and  $\beta g^*$  irresolute, then  $(g \circ f): (X, \tau) \rightarrow (Z, \eta)$  is slightly  $\beta g^*$  continuous if and only if  $g$  is slightly  $\beta g^*$  continuous.

**Proof:** Let  $O$  be a clopen set in  $(Z, \eta)$ . Since,  $(g \circ f): (X, \tau) \rightarrow (Z, \eta)$  is slightly  $\beta g^*$  continuous,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Since,  $f$  is surjective and pre  $\beta g^*$  open  $f(f^{-1}(g^{-1}(O))) = g^{-1}(O)$  is  $\beta g^*$  open in  $Y$ .

Hence,  $g$  is slightly  $\beta g^*$  continuous.

Conversely, let  $g$  is slightly  $\beta g^*$  continuous.

Let  $O$  be a clopen set in  $(Z, \eta)$ , then  $g^{-1}(O)$  is  $\beta g^*$  open in  $Y$ .

Since,  $f$  is  $\beta g^*$  irresolute,  $f^{-1}(g^{-1}(O))$  is  $\beta g^*$  open in  $X$ .

Hence,  $(g \circ f): (X, \tau) \rightarrow (Z, \eta)$  is slightly  $\beta g^*$  continuous.

**Theorem 6.21:** If  $f$  is a slightly  $\beta g^*$  continuous from a  $\beta g^*$  connected space  $(X, \tau)$  onto a space  $(Y, \sigma)$  then  $Y$  is not a discrete space.

**Proof:** Suppose that  $Y$  is a discrete space. Let  $O$  be a proper non-empty open subset of  $Y$ . Since,  $f$  is slightly  $\beta g^*$  continuous,  $f^{-1}(O)$  is a proper non-empty  $\beta g^*$  clopen subset of  $X$  which is contradiction to the fact that  $X$  is  $\beta g^*$  connected.

**Theorem 6.22:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a slightly  $\beta g^*$  continuous surjection and  $X$  is  $\beta g^*$  connected, then  $Y$  is connected.

**Proof:** Suppose  $Y$  is not connected, then there exists non-empty disjoint open sets  $U$  and  $V$  such that  $Y = U \cup V$ .

Therefore,  $U$  and  $V$  are clopen sets in  $Y$ .

Since,  $f$  is slightly  $\beta g^*$  continuous,  $f^{-1}(U)$  and  $f^{-1}(V)$  are non-empty disjoint  $\beta g^*$  open in  $X$  and  $X = f^{-1}(U) \cup f^{-1}(V)$ .

This shows that  $X$  is not  $\beta g^*$  connected.

This is a contradiction and hence,  $Y$  is connected.

**Theorem 6.23:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a slightly  $\beta g^*$  continuous and  $(Y, \sigma)$  is a locally indiscrete space then  $f$  is  $\beta g^*$  continuous.

**Proof:** Let  $O$  be an open subset of  $Y$ .

Since,  $(Y, \sigma)$  is a locally indiscrete space,  $O$  is closed in  $Y$ . Since,  $f$  is slightly  $\beta g^*$  continuous,  $f^{-1}(O)$  is  $\beta g^*$  open in  $X$ .

Hence,  $f$  is  $\beta g^*$  continuous.

**Theorem 6.24:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a slightly  $\beta g^*$  continuous and  $A$  is an open subset of  $X$  then the restriction  $f|_A : (A, \tau_A) \rightarrow (Y, \sigma)$  is slightly  $\beta g^*$  continuous.

**Proof:** Let  $V$  be a clopen subset of  $Y$ . Then  $(f|_A)^{-1}(V) = f^{-1}(V) \cap A$ .

Since  $f^{-1}(V)$  is  $\beta g^*$  open and  $A$  is open,  $(f|_A)^{-1}(V)$  is  $\beta g^*$  open in the relative topology of  $A$ . Hence,  $f|_A : (A, \tau_A) \rightarrow (Y, \sigma)$  is slightly  $\beta g^*$  continuous.
