Abstract:- Heterocyclic compounds have diverse biological properties due to which they are intensively studied and researched. Compounds. One of these compounds is quinazolinone which has been found to exhibit various medicinal properties. Activities. Quinazolinone with heterocyclic nucleus is a novel molecule that attracts chemists to make a new discovery. Therapeutic molecule. The current review article contains various quinazolinone and their various derivatives Substitution with antimicrobial activities.

Introduction:- Heterocyclic chemistry is a chemical consisting of heterocyclic compounds that contain at least two atoms. Various elements such as ring number. The rhombus can be inorganic, although the compound contains carbon atoms. The term ring, hetero, is different from carbon and hydrogen. Nitrogen containing heterocyclic compounds Plays an important role in medicinal chemistry. Quinazolinone consists of two fused benzene and pyrimidinone rings. Quinazolinones are a large class of active chemical compounds exhibiting a broad spectrum of biological activities In animals as well as humans. Literature studies on quinazolinones have shown that these derivatives have a. Many biological activities like antioxidant [1], antifungal [2], antibacterial [3], anticonvulsant [4] antiinflammatory [5], antihyperlipidemic [4], anticancer [,], antimalarial [ar], antispasmodial [4] analgesic [10] Antiviral [11], antitubercular [12] and antimicrobial [13] activities. Quinazolinones fuses are heterocycle classes that are of great interest due to the diverse range of Their biological properties. Quinazolinones will be classified into the following five categories, based on Replacement pattern of ring system; They are 2-Substituted -
$4[3 \mathrm{H}]$-Squinazolinone, 3-Substituted $-4[[3 \mathrm{H}]$ - Quinazoline, 4-substituted-quinazoline, 2,3-disubstituted-4 $[3 \mathrm{H}]$-quinazoline and 2,4-disubstituted-4 $[3 \mathrm{H}]$ quinazolinones. Based on the position of the keto group, these compounds can be classified into three types. They are 2 [1H] quinazolinone, 4 $[3 \mathrm{H}]$ quinazolinone and $2,4[1 \mathrm{H}, 3 \mathrm{H}]$ quinazolindione. Quinazolinone is one of the most important rhombic compounds, weak base with different biological activities. And still great scientific interest still a day. They are widely found in bio-inorganic and medicinal chemistry Application in drug discovery. This review was focused on quinazolinones and its various derivatives Occupies antimicrobial activities.

## Present work:

From the literature survey it is evident that 7 -substituted oxyquinolone attached quinazolinones exhibit promising type of antioxidant, anti-inflammatory, $\mathrm{H}_{1}$ antihistaminic and antitumor activity. In the present investigation it has been envisaged to introduce $\mathrm{CH}_{3} \mathrm{CO} / \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO} / \mathrm{ClCH}_{2} \mathrm{CO}$ in $7^{\text {th }}$ position of quinolone moiety and $\mathrm{CH}_{3}$ at $2^{\text {nd }}$ position of $4(3 \mathrm{H})$ quinazolinones and to evaluate the resulting molecules for possible antioxidant, anti-inflammatory, $\mathrm{H}_{1}$-antihistaminic and antitumor activities . Hence the synthesis of 6, 8-dibromo/ -3-(2-(7-acetyl/ benzoyl/ chloroacetyloxy-4-methyl-2-oxoquinolin-1(2H)-yl) ethyl)-2-methyl quinazolin-4(3H)-ones are taken up.Synthesis of the title compounds are shown in scheme 2A by adopting simple synthetic procedures. Six appropriate 6,8 dibromo/ -3-(2-(7-acetyl/benzoyl/ chloroacetyl oxy-4-methyl-2-oxoquinolin-1(2H)-yl)ethyl)-2-methylquinazolin-4(3H)-ones (RS19, RS22,RS25, X=H) (RS28, RS31, RS34, X=Br) were synthesized from dibromo/ anthranilic acids by a known procedure reported from this laboratory. The details of the synthesis are drawn in scheme 4.1.2 and 4.1.3 (scheme 2A). The IR, PMR and Mass spectrums are shown in 4.1.4 (Figure 4.1 and 4.2). The compounds profile of RS19, RS22, RS25, RS28, RS31, and RS34

## Experimental

General procedure for the synthesis of 7-hydroxy-4-methyl-2H-chromen-2-one (2A-II, step1):

A solution of resorcinol ( 0.1 mol ) and ethyl acetoacetate ( 0.1 mol ) was mixed with 160 g of polyphosphoric acid. The reaction mixture was stirred and heated at $75-80^{\circ} \mathrm{C}$ for 20 min and then poured into ice-water. The resultant pale yellow solid mixture was collected by suction filtration, washed with a little cold water and dried at $60^{\circ} \mathrm{C}$. Recrystallisation from dilute ethanol yields pure and colorless compound.

General procedure for the synthesis of 3-(2-(7-subs.oxy-4-methyl-2-oxoquinolin-1(2H)-yl)ethyl)-2-methylchloro-6,8-dihaloquinazolin-4(3H)-one

The appropriate 1-(2-aminoethyl)-7-substituted oxy-4-methylquinolin-2(1H)-one (0.1 mol) and 2-methylchloro-4 H - benzo[d][1,3]oxacin-4-one( 0.1 mol ) were taken in glacial acetic acid ( 40 mL ) and refluxed for 8 h . The course of the reaction was monitored every hour with the help of TLC. The excess solvent was then distilled off under reduced pressure and poured into crushed ice to get the solid. The final compounds were filtered, dried and purified by recrystalization from absolute ethanol.
