# ANALYSIS OF INCREMENTAL COST TOWARDS THE ACTIVE AND PASSIVE DESIGN STRATEGY IN A HIGH-RISE RESIDENTIAL GROUP DEVELOPMENT IN CHENNAI.

#### ANNAMALAI A

SPADE, Hindustan Institute of Technology and Science, Chennai, India.

#### ABSTRACT

Indian cities are witnessing immense demographic expansion due to migration from surrounding villages, leading to urban sprawl, housing demand, rise in cost of land. Housing has developed into an economy generating industry. Given this demand, while high-rise residential structures have become a solution in the metropolitan cities due to urbanization. The residential industry consumes lot of energy and materials and impact the environment. By sustainable development we meet the needs of the present without compromising the future generation needs and also reduce the negative impacts from the building. Where in the evidence from the literature highlights the incorporation of this will increase the cost of Construction.

As the Present real estate scenario is sluggish, from the real estate perspective to optimize the construction cost the sustainability developments is given the least priority.

The need for the study is to understand the incremental cost towards the Sustainability design features spent on a High-Rise Residential Group development in a Real estate Perspective in Chennai.

#### Keyword's: Real Estate, Sustainability, Passive design, Active design, Incremental cost, Additional FSI 1. INTRODUCTION

Real estate sector is the single most significant sectors in terms of CO2 contributions. The sector consumes over 40% of global energy annually and there is a projected 56% increase in building CO2 emissions by 2030 (World Economic Forum Industry Agenda Council on the Future of Real Estate & Urbanization). About 1/3rd of the CO2 emissions leading to climate change, has been attributed to building segment. With the concepts of "Housing for All" (Growth of Indian building sector CWF, 2010) there will be a possible increase in CO2 emissions.

To reduce the consumption& depletion of the natural resources and to save the energy and preserve for the future, the sustainable building becomes the most suitable solution. The Study is to analyze the Incremental cost towards the Active and passive design Strategy in a High-rise Group housing in Chennai.

#### 2. OBJECTIVE & METHODOLOGY

The Objective is to study the literature about the various Passive & Active design Strategy, with reference to IGBC & ECBC and incorporate those strategies in the design of high rise building and calculate the incremental cost.

The Methodology is as follows.

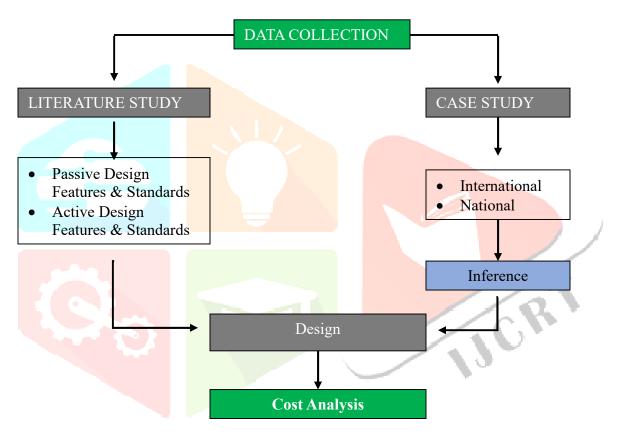

Figure 1: Methodology Flow Chart

Table 2: Case Study Inferences

#### 4. COST ANALYSIS

To analyze the cost, a 25 acres site at Porur, Chennai is taken and designed for Highrise group development based on the Inferences and references from Case study and Literature study, There are Three types of Blocks and each block have the combination of 1, 2 & 3 BHK Combination.

Each block is G+14 Floors and the building height is 49.5 m and the car parking is provided at the basement. The blocks are arranged to get maximum views and Facing towards the landscape & open spaces on two sides. Some of the blocks are connected at multiple levels which will acts a communal gathering space. There is viewing deck with the seating arrangement at the corridor to have a view towards the landscape.

Individual unit have cross ventilation and adequate natural lighting and open towards outside. Each unit will have a open terrace and this will be staggered vertically. This terrace is in addition to the balcony area. This terrace can be used as place for vertical landscaping and this creates shade to the building as well.

The design meets the requirements of the site selection, 15 % of landscape area, Heat Island effect roof and Non roof, Cross ventilation, Window wall ratio, Projection Factor, Use of Solar energy and Rain water harvesting for the roof and non-roof as per the IGBC & ECBC reference value and the cost is calculated.

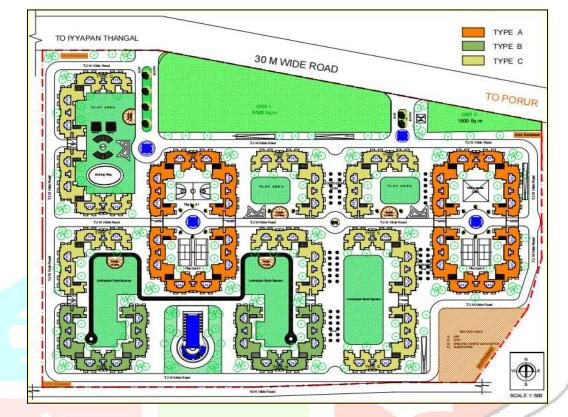

Figure 2: Site Plan

Table 4 : Cost Analysis

| Total Incremental cost | ₹ 45,67,29,527 | 4.45% |
|------------------------|----------------|-------|
| Incremental cost/Sq.ft | ₹ 107          |       |

#### **5. CONCLUSION**

The Cost analysis is done based on the design, for the key component of the Passive and the active design such as Landscaping, Cross ventilation, Natural lighting, shading devices, Heat Island effect of Roof and Non roof, Double glazing, AAC blocks, solar panels at the terrace, zero discharge of Rain water and found that the incremental cost is **4.45** % of the total project cost and it is approximately **Rs 107 /sq. ft** of increase in the construction cost.

By this increase in the additional cost, we have tangible and intangible benefits to the community in terms of enhancing the Living quality of the People by providing the Natural lighting and indoor environmental quality. By using the Low U value and double gazing the thermal transmission is less to the indoor and there by reduction in the HVAC load and corresponding electrical energy saved.

By considering the benefits towards the sustainability and protecting the natural resources, it is recommended to spent the additional cost to have a sustainable environment and preserve the natural resources for the Future. In a developer perspective to spend the additional/incremental cost and to benefit them as a policy can be brought in the Tamilnadu Development control rules (CMDA), for some percentage of additional FSI can be given if the project is meeting the Sustainable parameter and Green building certification.

This additional FSI will leads to additional saleable area for the developer and this motivates for the development of Sustainable buildings.
