Abstract:- Crypto currency is a global digital or electronic paperless currency that has a large circulation in the world today, so cyber security is very important for a large number of scams. The level goes down and the currency of one country goes to another country without any government process. In the case of crypto currency, it has been noticed that black money can be sent from one country to another and no one pays attention to it as it is not a public thing. We need to be aware of the process of using or acquiring this crypto currency by making changes inside. Crypto currency is the gift of the world and that is the future of many countries and India is participating in this future today and today India's Crypto Currency is being created globally so this is a project that we should implement which will lead to economic progress of the countries. It is often heard in the country that the account of Crypto currency is hacked and the crypto currency is sold by changing the account order in it. This is also an experiment.

Specification And Description :-

The crypto currency cyber scam is a high-level scam that no one knows whether it will happen in the future or now. One detail is that a person can buy crypto currency worth thousands of cores of rupees from a single phone because that facility is available today. Once a person buys it, he can buy it in any country's currency and put it in any country's bank account, whichever is his. To put it simply, a milkman who takes milk from one place to another, pours water first and sells it in another place. Crypto currency is the need of the hour and we need to stop this kind of scam and try to prevent it from happening again. The current form of crypto currency cyber scam is as follows:-

At present, there is no restriction on the government to buy or sell crypto currency, so in many places, crypto currency

scams are taking place and remittances are being sent to other countries.

Solution :-

We should use the bond paper system to stop this type of crypto currency cyber scam. In the bond paper system, when you want to sell this crypto currency in one of these forms, the bond paper must be

checked by the government agency in the country where it was first bought and sold in the currency of that country, then it must be converted into another country's currency. How crypto currency cyber scam will be sold with bond paper.

In this process of buying crypto currency, bond papers will be generated by the government machine only when someone buys it, so whenever you sell it, it will be sold in the currency of the same country.

Methodology :-

These things came to mind when buying and investing in crypto currency. There is a lot of scam going on and it will continue to happen if the government does not pay attention to it. Crypto currency is the need of the hour and the country. I personally sold the crypto currency in INR for USD and that's when I realized this. This system is working today as described in Specification And Description and it is very dangerous. This system is experimental and you can see this scam being used.
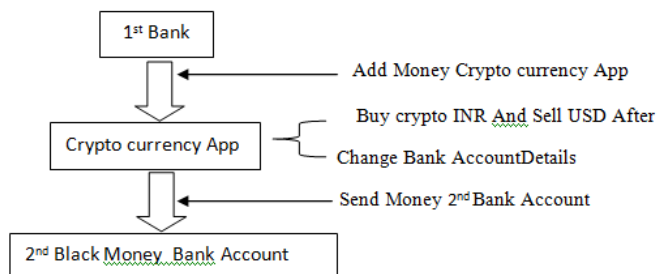

Claims :-

1. The global crypto currency scam will not happen on a large scale because the system is designed for that.

2. The government can take control of crypto currency and stop future scams now.

3. Crypto currency will be an easy way to do this when dealing within the country and the government can buy it as it knows how close the crypto currency is in the government system.

4. Types of crypto currency theft will disappear.

Objective of the Study :-

It has been selected for the study so that the money of the country stays in the country and financial crisis does not occur

and we can save it from becoming a scam in the country. The future of crypto currency can be made right now through this process so that crypto currency should be considered safe for everyone and it can be bought and sold for all to use.

Block Diagram:-

This is how it is bought now.

This is how the bond paper system can be purchased.

Conclusion:-

The future of crypto currency transactions can be eliminated by this process and a secure system can be created. 10 years ago the internet was not safe so it was not even used and today the whole world is using it because it is safe. Crypto currency is not considered safe by many countries today because it has a lot of scams and this is possible only if the bond paper system can be put in it and it can be secured. If it takes 10 years for the internet to feel secure, then the crypto currency country can feel secure in 10 days through this bond paper system process.
