#### Abstract

: In this short paper, non-zero integer distinct integer solutions to the surd equation with three unknowns given by $\sqrt{2 z}=\sqrt{x+i y}+\sqrt{x-i y}$ are obtained through the integer solutions of Pythagorean equation.

Keywords: surd equation, transcendental equation ,integer solutions

\section*{Introduction:}

Diophantine equations have an unlimited field of research by reason of their variety. Most of the Diophantine problems solved by the researchers are algebraic equations [1,2].

It seems that much work has not been done in finding the integer solutions to transcendental equations involving surds. In this context ,refer [3-18] to the integral solutions of transcendental equations involving surds .This short communication analyses a transcendental equation with three unknowns given by $\sqrt{2 z}=\sqrt{x+i y}+\sqrt{x-i y}$. Infinitely many non-zero integer triples $(x, y, z)$ satisfying the above equation are obtained through employing the integer solutions to the well-known Pythagorean equation.

## Method of analysis:

The surd equation to be solved is

$$
\begin{equation*}
\sqrt{2 z}=\sqrt{x+i y}+\sqrt{x-i y} \tag{1}
\end{equation*}
$$

On squaring both sides of (1) ,it simplifies to

$$
\begin{equation*}
\mathrm{z}=\mathrm{x}+\sqrt{\mathrm{x}^{2}+\mathrm{y}^{2}} \tag{2}
\end{equation*}
$$

the square-root on the R.H.S. of (2) ,take

$$
\begin{equation*}
x^{2}+y^{2}=\alpha^{2} \tag{3}
\end{equation*}
$$

which is nothing but the well-known Pythagorean equation satisfied by

$$
\begin{equation*}
x=r^{2}-s^{2}, y=2 r s, r \geq s \geq 0 \tag{4}
\end{equation*}
$$

and

$$
\alpha=r^{2}+s^{2}
$$

In view of (2),it is seen that

$$
\mathrm{z}=2 \mathrm{r}^{2}
$$

Thus,(4) and (5) represent the integer solutions to (1).
A few numerical solutions are presented in Table: 1 below
Table:1 Numerical solutions

| r | s | x | y | z |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | 1 | 3 | 4 | 8 |  |
| 3 | 2 | 5 | 12 | 18 |  |
| 4 | 2 | 12 | 16 | 32 |  |
| 5 | 3 | 16 | 30 | 50 |  |

It is worth mentioning that , (3) is also satisfied by

$$
\begin{equation*}
x=2 r s, y=r^{2}-s^{2}, r \geq s \geq 0 \tag{6}
\end{equation*}
$$

and

$$
\alpha=\mathrm{r}^{2}+\mathrm{s}^{2}
$$

From (2) ,the value of $z$ is given by

$$
\begin{equation*}
\mathrm{z}=(\mathrm{r}+\mathrm{s})^{2} \tag{7}
\end{equation*}
$$

Thus, (6) and (7) satisfy (1).

A few numerical solutions are presented in Table:2 below
Table:2 Numerical solutions

| r | s | x | y | z |
| :--- | :--- | :--- | :--- | :--- |
| 2 | 1 | 4 | 3 | 9 |
| 3 | 2 | 12 | 5 | 25 |
| 4 | 2 | 16 | 12 | 36 |
| 5 | 3 | 30 | 16 | 64 |

Further, (3) is also satisfied by

$$
\begin{align*}
& x=\left(r^{2}+s^{2}\right)\left[\left(A^{2}-B^{2}\right)\left(r^{2}-s^{2}\right)-4 r s A B\right] \\
& \left.y=\left(r^{2}+s^{2}\right)\left[\left(A^{2}-B^{2}\right) 2 r s+2 A B\left(r^{2}-s^{2}\right)\right]\right) \tag{8}
\end{align*}
$$

and

$$
\alpha=\left(\mathrm{r}^{2}+\mathrm{s}^{2}\right)^{2}\left(\mathrm{~A}^{2}+\mathrm{B}^{2}\right)
$$

From (2), the value of z is given by

$$
\begin{equation*}
\mathrm{z}=2\left(\mathrm{r}^{2}+\mathrm{s}^{2}\right)(\mathrm{Ar}-\mathrm{B} s)^{2} \tag{9}
\end{equation*}
$$

Thus, (8) and (9) satisfy (1). It should be remembered that the values of $r, s, A$ and $B$ are chosen so that x and y are non-zero positive integers as they represent the legs of pythagorean triangle.

A few numerical solutions are presented in Table: 3 below
Table:3 Numerical solutions

| A | B | r |  | s | x | y | z |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | 1 | 4 |  | 1 | $17 * 13$ | $17^{*} 84$ | $34^{*} 49$ |
| 3 | 1 | 4 |  | 1 | $17 * 72$ | $17^{*} 154$ | $34^{*} 121$ |
| 4 | 2 | 5 |  | 1 | $26^{*} 128$ | $26^{*} 504$ | $52^{*} 324$ |

## Conclusion:

In this paper, we have presented integer solutions
to the surd equation with three unknowns given by $\sqrt{2 z}=\sqrt{x+i y}+\sqrt{x-i y}$. To conclude one may attempt to find integer solutions to other choices of surd equations .with unknowns three or more than three.
