**Abstract:** In recent years, credit cards have become the most popular payment method. As technology advances, so does the quantity of fraud instances, necessitating the development of a fraud algorithm for accurately detect and eliminate fraudulent actions. People have been looking for creative ways to illegally access someone's finances since the invention of payment systems. This threat has escalated in recent years, as the vast majority of transactions are now conducted totally online with credit card information. Credit Card Fraud is a broad term that applies to any sort of fraud employing a payment card, particularly a credit card. The sole goal of such infractions is usually to obtain products as well as services, or to pay a significant transfer to another account even without owner's permission. This project intends to concentrate mostly on algorithms for machine learning. Here a comparative study between several algorithms namely SVM, Decision Tree, Naïve Bayes, KNN and Logistic Regression has been done. The Logistic regression algorithm has been employed due to its better accuracy. The accuracy is being used to calculate the results. Thus, a predictive study has been developed which is used to compute the status of any credit card with respect to the transaction.

**Keywords - Credit Card, Fraud, Algorithms, Logistic Regression, Accuracy, Predictive system.**

## I. INTRODUCTION

Fraud involving credit cards is an increasing concern in today's society, as is fraud in public offices, corporate industries, financial industries, and a variety of other organizations. In today's society, the heavy reliance on the internet is the cause of a spike in credit card fraud transactions, although fraud has increased not only internet but also offline. Although information retrieval techniques [1] are applied, the results are not very reliable in detecting credit card fraud. The only way to lower these costs is really to defraud using efficient algorithms, which is a plausible method of reducing credit card scams. The only way to reduce these costs is to detect fraud using efficient algorithms, which is a promising technique to reduce credit card fraud. The major goal is to create a fraud detection system that detects fraudulent transactions in less time and with more accuracy by utilizing machine learning-based categorization techniques. As technology advances, cash payments are decreasing and online payments are increasing, allowing fraudsters to conduct anonymous transactions.

In some online payment methods, only the cardholder name, maturity date, and CVV are necessary, and that data may be lost without our knowledge; in some circumstances, we are unaware that our data is being taken. We are unaware that our data has been leaked due to purchases made over the internet when criminals utilize phishing techniques to obtain the details. He only requires card data for some purchases to commit fraud, and the user may

not be aware that his/her credit card information has been compromised. The card information should be kept secret. Information may be disclosed as a result of phishing sites, and the device could be lost or stolen. The best technique to determine if a transaction is fraudulent or not is to examine the customer's purchasing habits using available data and utilize machine learning to determine whether such a transaction is legitimate or not.

Fraud in any form is a criminal offence, and credit card fraud means stealing money. Many research have been conducted to determine if a transaction is fraudulent or not. Having several hurdles and attempting to overcome them [2]. To begin, many employed Data Mining Methods to detect fraudulent transactions by employing some unconventional methodology, and these days criminals are so skilled that they may commit fraud without breaking any regulations [3]. As a result, using computer vision is common. So, in this case, a significantly unbalanced data set is analyzed in order to provide us with the optimal algorithm to apply along with its problems. Because it is heavily imbalanced, regardless of whether the proposed method is efficient or not, it provides an accuracy of around 99.9%. As in [4], under sampling is thought to produce beneficial outcomes in this case. As shown in [5], outlier detection and eradication techniques are utilized to accurately identify fraudulent transactions in a credit card payment dataset.

People in today's generation are more interested in receiving things online than going out and buying them, and as a result, the rise of ecommerce platforms is increasing, as is the risk of credit card theft. To minimize such financial crimes, we must first identify the optimum algorithm for decreasing credit card frauds.

## II. RELATED WORK

New ways for detecting credit card fraud using a variety of research methods or fraud detection tools, with a focus on neural network models, data analysis, and distributed storage mining. A variety of other techniques are employed to detect credit card fraud. After conducting a literature review on multiple methodologies of credit scoring, we can infer that there are many additional ways in Machine Learning on its own to recognize credit card fraud.

Fraud detection using credit cards research employs combination Machine Learning[6][7] and Computational Intelligence algorithms[8]. In this segment, we improve the job completed in two areas: (i) the widely available tool for detecting fraud, and (ii) the approaches for dealing with imbalanced data. A [9] provides some ways for dealing with unbalanced data. They are (a) modular, (b) sampling methods, and (c) procedures that are similar.

In 2019, Yashvi Jain, Namrata Tiwari, Shripriya Dubey, and Sarika Jain studied various techniques [10] for credit card fraud detection, including support vector machines (SVM), artificial neural networks (ANN), Gradient boosting, Markov Prototype, K-Nearest Neighbours (KNN) Proposed Fuzzy system, and Decision Trees. In their paper, they discovered that the k-nearest neighbor, decision trees, and SVM algorithms provide medium-level accuracy. A high detection rate is provided by neural networks, naïve bayes, fuzzy systems, and KNN. Algorithm pertaining to Logistic Regression & fuzzy logic imposed lowest accuracy. At the middle level, the LogisticRegression, SVM, decision trees provide a high detection rate. There are two methods, ANN and Nave Bayesian Networks, that perform better across all parameters. These are quite expensive to train. All algorithms have a significant flaw. The disadvantage is that these techniques do not produce the same results in various contexts. They produce better outcomes with one type or dataset and worse results with another.

Heta Naik and Prashasti Kanikar conducted research on numerous algorithms [11] in 2019. Among the categorization algorithms, Nave Bayes stands out. Bayes' theorem determines the likelihood of an event occurring. Logistic regression algorithms are comparable to linear regression algorithms.

In 2019, Sahayasakila V, D.Kavya Monisha, Aishwarya, Sikhakolli Venkatavisalakshishwshai Ysaswi revealed the Whale Optimization Techniques (WOA) and SMOTE, two essential algorithmic techniques [12]. They were primarily concerned with increasing convergence speed and resolving the data imbalance issue. The SMOTE and WOA techniques are used to solve the class imbalance problem. The SMOTE technique discriminates all synthetic transactions, which are then re-sampled to ensure data accuracy and optimised using the WOA technique. The method also enhances the system's convergence speed, accuracy, and efficiency.

Navanushu Khare and Saad Yunus Sait [13] presented their work in 2018. They started with a very skewed dataset and moved their way up. Accuracy, sensitivity, precision, are used to assess project. The accuracy for Logistic Regression is 97.7%, Decision Trees is 95.5%, Random Forest is 98.6%, and SVM classifier is 97.5%, according to the results. They discovered that perhaps the Random Forests really does have the maximum accuracy of all the methods and is the best algorithm for detecting fraud. They also discovered that now the SVM algorithm suffers from data imbalance and does not perform much better in detecting credit card fraud.

**III. PROPOSED WORK**

The work has been conceptualized in figure(i)..

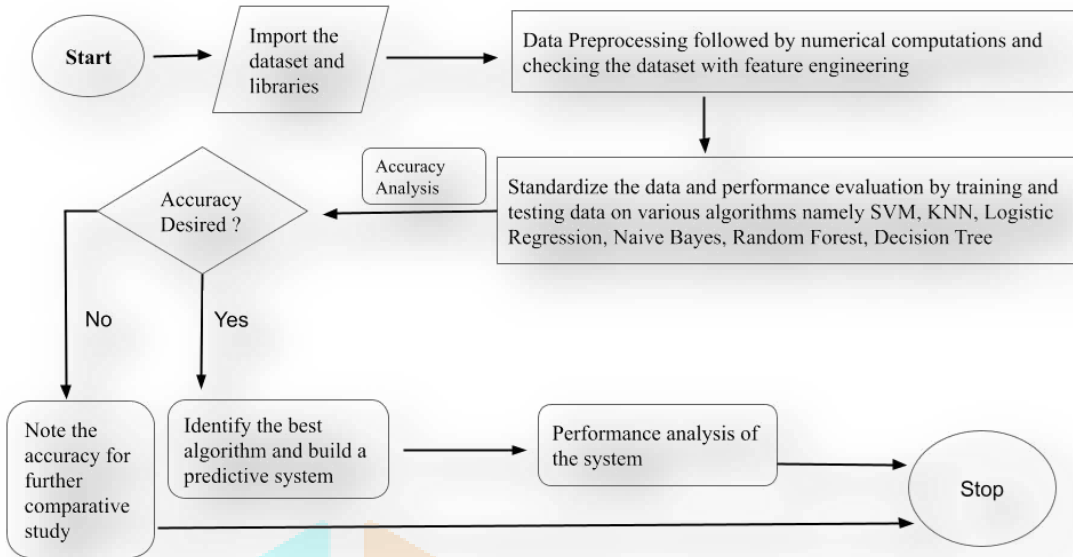

Figure (i) - Proposed Methodology

Initially dataset has been gathered and machine learning pipeline has been initiated. Machine Learning follows mainly the principle of training data proceeding testing the model and checking for predictions and further deployment. The pipeline of machine learning workflow has been identified in figure (ii).

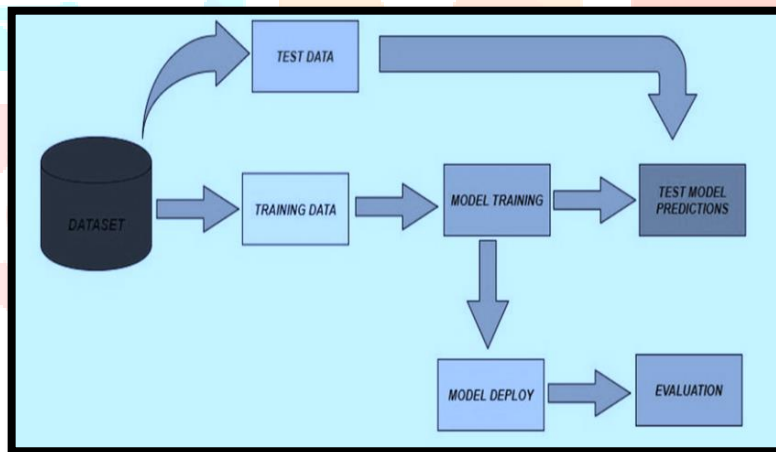

Figure (ii): Machine Learning workflow

Following this pipeline the algorithms namely Random Forest, KNN, Decision Tree, Naïve Bayes and Logistic Regression are deployed on this particular dataset to compute credit card frauds and it is visualized that Logistic Regression performs best on testing data and it is further required to develop a predictive system which can easily identify the specific fraudulent transaction pertaining to any particular card.

- Decision Tree

[ ] clf = tree.DecisionTreeClassifier()

[ ] clf.fit(X_train, Y_train)

DecisionTreeClassifier()

[ ] X_train_prediction = clf.predict(X_train)
training_data_accuracy = accuracy_score(Y_train, X_train_prediction)

[ ] print('Accuracy score of training data : ', training_data_accuracy)

Accuracy score of training data : 1.0

[ ] # accuracy score on training data
X_test_prediction = gnb.predict(X_test)
test_data_accuracy = accuracy_score(Y_test, X_test_prediction)

[ ] print('Accuracy score of test data : ', test_data_accuracy)

Accuracy score of test data : 0.6410256410256411

```

Figure (xiv):- Accuracy of Decision Tree

```

- Logistic Regression

[ ] LG = LogisticRegression(random_state=0)

[ ] LG.fit(X_train, Y_train)

LogisticRegression(random_state=0)

[ ] X_train_prediction = LG.predict(X_train)
training_data_accuracy = accuracy_score(Y_train, X_train_prediction)

[ ] print('Accuracy score of training data : ', training_data_accuracy)

Accuracy score of training data : 1.0

[ ] # accuracy score on training data
X_test_prediction = LG.predict(X_test)
test_data_accuracy = accuracy_score(Y_test, X_test_prediction)

[ ] print('Accuracy score of test data : ', test_data_accuracy)

Accuracy score of test data : 1.0

```

Figure (xv):- Accuracy of Logistic Regression

Thus, the comparative study between various algorithms with respect to their algorithms can be summarized as below in table 1:

Sl. No	Algorithm Name	Training Accuracy	Testing Accuracy	Rank Based on Accuracy
1	Decision Tree	100%	64.10%	4
2	Random Forest	96.15%	89.74%	3
3	Logistic Regression	100%	100%	1
4	Naïve Bayes	78.84%	64.10%	5
5	KNN	97.43%	97.43%	2

Table 1: Comparative study of algorithms

So, from Table 1, it is clear that Logistic Regression performs best and Naïve Bayes has lease accuracy on performance. Therefore, predictive system is developed with the help of Logistic Regression algorithm.

```

Predictive System

[ ] input_data = (197.07600,206.89600,192.05500,0.00289,0.00001,0.00166,0.00168,0.00498,0.01098,0.09700,0.00563,0.00

# changing input data to a numpy array
input_data_as_numpy_array = np.asarray(input_data)

[ ] # reshape the numpy array
input_data_resaped = input_data_as_numpy_array.reshape(1,-1)

[ ] import keras
from keras.models import Sequential
from keras.layers import Dense
from keras.models import load_model

#empty model
classifier = Sequential()

prediction = classifier.predict(input_data_resaped)
print(prediction)

1/1 [=====] - 0s 235ms/step
[[ 1.970760e+02  2.068960e+02  1.920550e+02  2.890000e-03  1.000000e-05
  1.660000e-03  1.680000e-03  4.980000e-03  1.098000e-02  9.700000e-02
  5.630000e-03  6.800000e-03  8.020000e-03  1.689000e-02  3.390000e-03
  2.677500e+01  4.222290e-01  7.413670e-01 -7.348300e+00  1.775510e-01
  1.743867e+00  8.556900e-02]]

if (prediction[0].any == 0):
    print('Fraud Detected')
else:
    print('Fradulent Transactions is not there')

[ ] Fradulent Transactions is not there

```

Figure (xvi):- Predictive System

## V. CONCLUSION

From this work, we can conclude that a predictive system is developed with the help of Logistic Regression algorithm that performed best on this respective dataset to compute the fraud for a particular credit card. This system will help to check and identify any sort of fraudulent transaction on any credit card

## VI. ACKNOWLEDGMENT

We would like to thank all the faculty and staff members from the Department of Biomedical Engineering and Department of Electrical Engineering for their support.
