I. INTRODUCTION

The Binary Quadratic equation of the form \( y^2 = Dx^2 + 1 \) where \( D \) is non-square positive integer has been studied by various mathematicians for its non-trivial integral solutions when \( D \) takes different integral values [1,2,3,4]. In [5] infinitely many Pythagorean triangles in each of which hypotenuse is four times the product of the generators added with unity are obtained by employing the non-integral solutions of binary quadratic equation \( Y^2 = 3X^2 + 1 \). In [6], a special Pythagorean triangle is obtained by employing the integral solutions of \( Y^2 = 10X^2 + 1 \). In [7] different patterns of infinitely many Pythagorean triangles are obtained by employing the non-integral solutions of \( Y^2 = 5X^2 + 1 \). In this context one may also refer [8-11]. These results have motivated us to search for the integral solutions of yet another binary quadratic equation \( y^2 = 14x^2 + 4 \) representing a hyperbola. A few interesting properties among the solutions are presented.

II. METHOD OF ANALYSIS

The positive pell equation representing hyperbola under consideration is

\[ y^2 = 14x^2 + 4 \]  \hspace{1cm} (1.1)

whose smallest positive integer solution is

\[ x_0 = 8, y_0 = 30 \]

To obtain the other solutions of (1.1), consider the pell equation

\[ y^2 = 14x^2 + 1 \]

with initial solution is

\[ \tilde{x}_0 = 4, \tilde{y}_0 = 15 \]

whose general solutions is given by

\[ \tilde{x}_n = \frac{1}{2\sqrt{14}} g_n, \tilde{y}_n = \frac{1}{2} f_n \]

where
\[ f_n = (15 + 4\sqrt{14})^{n+1} + (15 - 4\sqrt{14})^{n+1} \]
\[ g_n = (15 + 4\sqrt{14})^{n+1} - (15 - 4\sqrt{14})^{n+1} \]

Applying Brahmagupta's lemma between \((\overline{x_n, y_n})\) and \((\overline{x_{n+1}, y_{n+1}})\), the other integer solutions of (1.1) are given by

\[ x_{n+1} = 4f_n + \frac{15}{\sqrt{14}} g_n \]  
(1.2)

\[ y_{n+1} = 15f_n + 4\sqrt{14} g_n \]  
(1.3)

**To find the recurrence relation of** \( y_{n+1} \):

Replacing \(n+1\) by \(n+2\) and \(n+3\) in (1.3) in turn, we get

\[ y_{n+2} = 449f_n + 120\sqrt{14} g_n \]  
(1.4)

\[ y_{n+3} = 13455f_n + 3596\sqrt{14} g_n \]  
(1.5)

From (1.3), (1.5) and (1.6) we get,

\[ y_{n+1} - 30y_{n+2} + y_{n+3} = 0 \]

**To find the recurrence relation of** \( x_{n+1} \):

Replacing \(n+1\) by \(n+2\) and \(n+3\) in (1.2) in turn, we get

\[ x_{n+2} = 120f_n + \frac{449}{\sqrt{14}} g_n \]  
(1.6)

\[ x_{n+3} = 3596f_n + \frac{13455}{\sqrt{14}} g_n \]  
(1.7)

From (1.2), (1.6) and (1.7) we get,

\[ x_{n+1} - 30x_{n+2} + x_{n+3} = 0 \]

Then the following interesting relations are observed:

i. \[\alpha - 7\beta + 6\gamma = 4\]
ii. \( \frac{2A}{p} = x_{n+1}y_{n+1} \)

iii. \( \frac{Z - Y}{16} \) is a cubical number

iv. \( \frac{Z - Y}{8} \) is a biquadratic number

IV. CONCLUSION:

In this dissertation, we have presented infinitely many integer solutions for the hyperbola presented by the positive Pell equation and as the binary quadratic Diophantine equation are rich in variety, one may search for the other choices of positive Pell equations and determine their integral solution along with suitable properties.
