Abstract

Atthi pattai (Ficus racemosa bark) chooram is one of the siddha herbal drugs, which has been indicated for its antimicrobial activity. The aim of the present study was to validate antimicrobial activity of Atthi pattai chooranam extract against various micro-organisms. The micro-organisms used in the present study include Escherichia coli, Staphylococcus aureus, Streptococcus pneumoniae, Pseudomonas aeruginosa and Candida albicans. The antimicrobial study was conducted according to Kirby-Bauer Method. It was observed that Atthi pattai chooranam extract exerted antimicrobial activity against Staphylococcus aureus.

KEYWORDS

Anti-microbial activity, Ficus racemosa bark, Staphylococcus aureus.

INTRODUCTION

Siddha system of Medicine is the ancient, unique and potent among all systems of medicine. It was invented by Siddhars who were the spiritual scientists of the ancient of Tamil Land. It has not only the curative and preventive effects on different diseases but also paves the way for the longevity and immortality. Bacterial infection is one of the most serious global health in 21st Century. Many antibiotics are being developed to treat but their misuse is causing the so-called drug-resistant. So, the search of new antimicrobial agents has become indispensable. Nearly 1340 plants are known to be potential sources of anti-bacterial agents. There are several single and polyherbal siddha formulations used against microbial disorders in siddha. Atthi pattai is one of the most widely used herbs in siddha system of medicines for centuries against various ailments. Ficus racemosa belongs to the Moraceae family. All parts of the plant are medicinal cure. Bark of the plant cures dysentery, spongy gums, ulcers, diabetes, asthma, leucorrhrea and urinary problems. Bark is astringent, refrigerant and anti-diabetic. A decoction of bark is used as a wash for wounds. It is useful in asthma, piles and menorrhagia. Leaves and bark are used as poultice for eczema.

MATERIALS & METHODS

PLANT MATERIAL

The fresh bark of Ficus racemosa were collected from in and around Palayamkottai, Tamil Nadu, India. The specimen of the bark was identified and authenticated by the botanists and experts of Gunapadam department, Govt. Siddha Medical College, Palayamkottai, Tamil Nadu, India. The bark of Ficus racemosa were cleaned well and allowed for completely drying in a shadow place. Then the bark was cut into pieces and made into powder form by using stone mortar. This powder was sieved by thin white cloth and purified by the method mentioned in the siddha classical text. After purification, the powder form of bark was preserved in an airtight container.

ANTI–MICROBIAL ACTIVITY BY KIRBY BAUER METHOD

PROCEDURE

The method of antimicrobial activity study is UPS Diffusion Method. Antibiotic discs are prepared with known concentration of antibiotic and placed on agar plates that has been inoculated with the known pathogenic microorganism. The antibiotic diffuses through the agar producing an antibiotic concentration gradient, antimicrobial susceptibility is proportional to the diameter of the inhibitory zone around the disc. If the microorganism which grows up to the edge of the disc is resistant to the antimicrobial agent.

The recommended medium in this method is Mueller Hinton Agar, its pH should be between 7.2 – 7.6 and should be poured to uniform thickness of 4mm in the petri plate (25ml)

METHODOLOGY

- Mueller Hinton Agar plates are prepared and Escherichia coli, Candida albicans, Staphylococcus aureus, Streptococcus pneumoniae, Pseudomonas aeruginosa are inoculated separately.
- The prepared discs of Atthi Pattai Chooranam are placed over the incubated plate using sterile forceps and incubated for 24 hours at 37º Celsius.
- The plates after 24 hours incubation is observed for the zone of inhibition.

RESULTS AND DISCUSSION

The activity of atthi pattai chooranam showed significant inhibition of bacterial growth in the culture plates against Staphylococcus aureus as shown in Table 1 and Figure 1. S.aureus is the causative agent of wide variety of disease of suppurative infections such as boils and wound infections, superficial infection such as skin pustule, subcutaneous and submucosa abscess, osteomyelitis, broncho pneumonia and food poisoning, a common cause of vomiting and diarrhoea.

CONCLUSION

The study suggests that Atthi pattai chooranam have potential against pathogenic microbes and can be used as antimicrobial agent for treatment of various infectious diseases.

ACKNOWLEDGEMENT

I express my immense gratitude to the Principal, Head of the department and lecturers of PG department of Gunapadam, Govt. Siddha Medical College, Palayamkottai, Tamil Nadu, India and Mr Napolean consultant microbiologist, Malar diagnostic centre, Palayamkottai, Tamil Nadu, India.
