‘Interactional Effect of Professional Commitment and Job Involvement on Non-Accomplishment and Depersonalization Dimensions of Burnout’

Dr. Pardeep Singh Dehal
Assistant Professor
Deptt. of Education, ICDEOL
HPU Shimla-5

Abstract: Teaching has been one of the oldest and most respected professions in the world. The task of teacher is shaping the future of citizens and thereby society and nation. Due to respectful duty, teacher has been respectful in all society through ancient to Buddhist period. In the modern period teacher is regarded as a custodian and architect of a nation. Today, there are many duties and responsibilities of a teachers working at different level of education. Burnout is the outcome of excessive stress. Many illnesses like liver and heart disease are likely due to psychological stresses of modern life. The percentage of burnout is likely higher today. Better understanding of this stress outcome has to be promoted.

The study was delimited to the thirty four governments and private degree Colleges located in territory of Himachal Pradesh and seven districts i.e. Hamirpur, Bilaspur, Una, Kangra, Shimla Chamba and Mandi of Himachal Pradesh.

The investigator in the present study has adopted descriptive survey method. The population for the present study comprised teachers teaching degree classes in government and private (aided and non-aided) colleges affiliated to Himachal Pradesh University. Since, it was not possible to cover all the colleges in the State of Himachal Pradesh, stratified random sampling technique was applied, first for selection of colleges by giving due weightage to type of management, mode of appointment, location and gender and secondly to draw the sample of 546 teachers from the colleges. In the present study, the researcher used the following tools for collection of data: Burnout Inventory (BI) developed by Karuna Shankar Misra (2005). Means, S.Ds. and t-value used as a statistical techniques to analyse and interpret the data.
Keywords: Burnout, Accomplishment, Depersonalization, Professional Commitment, Depersonalization

Introduction: Maslach worked intensively in the area of burnout. The researcher developed an inventory that used three dimensional description viz. exhaustion, cynicism and inefficacy to represent burnout. The ‘exhaustion only’ model that sees symptom as the hallmark of burnout was advocated and advanced by Maslach, Jackson & Leiter (1996), Shirom and Melamed (2005), and Krishtensen, Borritz, Villadsen and Christensen (2005).

The Maslach Burnout inventory was used by Worley et al. (2008) for studying the three factors namely emotional exhaustion, personal accomplishment and depersonalization of an individual. However, Mishra (2005) used non-accomplishment, depersonalization, emotional exhaustion, friction, task avoidance, distancing neglecting and easy going approach as the indicators of burnout among teachers. Depending on the particular case, burnout may be alleviated by changes in the work environment and job demands, as well as changes in the individual's behaviour and approach to work. If nothing changes, however, burnout tends to create a downward spiral, in which an unsustainable situation leads to exhaustion and dissatisfaction, which leads to poor performance, which in turn leads to a worsened work situation or even job loss and increased stress on the individual. The field of education was included in the list of investigations at a later stage. Teachers are often expected to correct social evils or problems while educating the students in academic and skill areas, providing enrichment activities, meeting the individual needs of students and encouraging student’s moral and ethical development. Teachers have found their credibility eroding with large community. Politicians, corporate executives and educational experts have expounded conflicting answers for correcting the ills of education. Their solutions are often simplistic, neglecting the complex social constrains under which teachers work and often blame the teachers for the problem they face. As a result of these problems many teachers leave the profession, suffers stress and burnout. Hendrickson (1979) defined teacher’s burnout as exhaustion of physical, emotional and attitudinal state of mind. It begins with the feeling of uneasiness and in this state; the joy of teaching begins to gradually dip. Teacher suffering from burnout appears overwhelmed, exhausted, cynical, irritable and withdrawn.

OBJECTIVE OF THE STUDY:

To study the interactional effect of professional commitment and job involvement on non-accomplishment and depersonalization Dimensions of burnout related to college teachers in Himachal Pradesh.
HYPOTHESIS OF THE STUDY:

There is no significant interactional effect of professional commitment and job involvement on non-accomplishment and depersonalization Dimensions of burnout related to college teachers in Himachal Pradesh.

DELIMITATIONS OF THE STUDY:

The study was delimited to:

(i) thirty four government and private degree Colleges located in territory of Himachal Pradesh.

(ii) seven districts i.e. Hamirpur, Bilaspur, Una, Kangra, Shimla Chamba and Mandi of Himachal Pradesh.

(iii) teachers of three educational stream viz. Arts, Science and Commerce of bachelors degree

METHODOLOGY OF THE STUDY: This chapter deals with description of method and procedure adopted to complete the present study. The plan and procedure is a blueprint of a research study. Without planning, a researcher cannot achieve objectives with good reliability and validity. Therefore, method and procedure of any research is essential for quality information and thereby quality findings. The investigator in the present study has adopted descriptive survey method.

The descriptive method involves quantitative information that can be tabulated along a continuum in numerical form. It involves gathering data that describe events and then organizes, tabulates, depicts, and describes the data collection (Glass & Hopkins, 1984). Descriptive research summarized many information in form of mean, median, mode, standard deviation, variance, percentage, correlation between variables etc. The descriptive research often uses quasi-experimental research design (Campbell & Stanley, 1963). Data collection in descriptive research includes surveys, interviews, observations, and portfolios. The descriptive research involves the description, recording, analysis and interpretation of conditions that exist. It involves some types of comparison or contrast and attempts to discover relationships between existing non-manipulated variables (Best, 1981).
Population and Sample of the Study:

Population is the entire aggregation of cases or units that meet criteria set by investigator. According to Best (2007), “A population is any group of individuals who have one or more characteristics in common that are of interest to the researcher. The population for the present study comprised teachers teaching degree classes in government and private (aided and non-aided) colleges affiliated to Himachal Pradesh University. Since, it was not possible to cover all the colleges in the State of Himachal Pradesh, stratified random sampling technique was applied, first for selection of colleges by giving due weightage to type of management, mode of appointment, location and gender and secondly to draw the sample of 546 teachers from the colleges.

Tools and Techniques Used: A researcher requires many data-gathering tools or techniques. Tools are essential for measurement of traits of variables and they guide the researcher in data collection and also in evaluation. In the present study, the researcher used the following tools for collection of data:

Burnout Inventory (BI) developed by Karuna Shankar Misra (2005).

The Burnout Inventory used in the present study was originally developed by Karuna Shankar Misra to measure burnout among teachers working in higher education. The BI contains 48 items and it measures burnout in terms of eight dimensions namely Emotional Exhaustion, Depersonalization and Non-accomplishment, Friction, Task avoidance, Distancing, Neglecting and Easy going. Descriptive statistics like mean, S.D., skewness and kurtosis were calculated to see normality and other purposes. To find out difference between two groups t-test was used. To find interaction between professional commitment and job involvement on burnout, two-way analysis of variance is applied here.

Analysis and Interpretation of the Data:

After data collection and analysis of data, main work of researcher is to present results and interpretation in systematic and effective way.

Interactional Effects of Professional Commitment and Job Involvement on Non-accomplishment and Depersonalization Dimension of Burnout:

The interaction between professional commitment and job involvement on burnout was found using two-way analysis of variance. Results of two-way analysis for total burnout and its dimensions are given in different sections below.
Interactional Effect of Professional Commitment and Job Involvement on Non-Accomplishment Dimensions of Burnout

Summary of two-way analysis of variance for interaction between professional commitment and job involvement on non-accomplishment dimension of burnout is given in 1.

Table: 1

Summary of two way ANOVA showing interactional effect of professional commitment (PC) and job involvement (JI) on non-accomplishment dimension of burnout

<table>
<thead>

<th>Df</th>
<th>Mean Sum of Square</th>
<th>F</th>
<th>Prob.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Effects</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PC</td>
<td>127.852</td>
<td>2</td>
<td>63.926</td>
<td>2.130</td>
<td>.120</td>
</tr>
<tr>
<td>JI</td>
<td>332.802</td>
<td>2</td>
<td>166.401</td>
<td>5.543</td>
<td>.004*</td>
</tr>
<tr>
<td>2-Way Interactions</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PC X JI</td>
<td>204.499</td>
<td>4</td>
<td>51.125</td>
<td>1.703</td>
<td>.148</td>
</tr>
<tr>
<td>Residual/Error</td>
<td>16119.745</td>
<td>537</td>
<td>30.018</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>17103.231</td>
<td>545</td>
<td>31.382</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 1 shows that F-values for main effect of PC and JI are 2.130 and 5.543 respectively. Probability of main effect of job involvement is significant while not significant for professional commitment on non-accomplishment dimension of burnout of college teachers. F-value for interaction between PC and JI is 1.703. Probability of this F-value is 0.148 which is greater than 0.05. This means that interaction between PC and JI is not significant on non-accomplishment dimension of burnout of college teachers.

Therefore null hypothesis $H_0$ that “There are no significant interactional effects of professional commitment and job involvement on burnout of college Teachers in Himachal Pradesh” is not rejected for non-accomplishment dimension of burnout.
Interactional Effect of Professional Commitment and Job Involvement on Depersonalization Dimensions of Burnout

Summary of two-way analysis of variance for interaction between professional commitment and job involvement on depersonalization dimension of burnout is given in Table 2

Table: 2

Summary of two way ANOVA showing interactional effect of professional commitment and job involvement on depersonalization dimension of burnout

<table>
<thead>
<tr>

<tr>
<td>PC</td>
<td>451.880</td>
<td>2</td>
<td>225.940</td>
<td>8.371</td>
<td>.000*</td>
</tr>
<tr>
<td>JI</td>
<td>545.445</td>
<td>2</td>
<td>272.722</td>
<td>10.105</td>
<td>.000*</td>
</tr>
<tr>
<td>2-Way Interactions</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PC X JI</td>
<td>329.555</td>
<td>4</td>
<td>82.389</td>
<td>3.053</td>
<td>.017*</td>
</tr>
<tr>
<td>Residual/Error</td>
<td>14493.492</td>
<td>537</td>
<td>26.990</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>15963.005</td>
<td>545</td>
<td>29.290</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 2 shows that F-values for main effect of PC and JI on depersonalization dimension of burnout are 8.371 and 10.105, respectively. Probability of these F-values are much less than 0.05. This means that main effect of PC and JI on depersonalization are significant. F-value for interaction between PC and JI on depersonalization is 3.053. Probability of this F-value is 0.017 which is less than 0.05. This means that interaction between PC and JI on depersonalization is significant. This indicates that main effect is coloured. In this case, it is essential to control one factor to see effect on other.

Therefore, null hypothesis $H_{07}$, that “There are no significant interactional effects of professional commitment and job involvement on burnout of college Teachers in Himachal Pradesh”, is rejected for depersonalized dimension of burnout.
RESULTS AND CONCLUSION:

Significant difference was found among college teachers with low, average and high professional commitment on non-accomplishment, depersonalization, dimensions of burnout. Interaction between professional commitment and job involvement were found on burnout dimensions like depersonalization and non-accomplishment.

SUGGESTIONS FOR FURTHER STUDY:

Suggestions for further study are internal visions of researcher that he realized during conduction of research. Following researches will be fruitful for future researchers in the area of present study:

1. A study should be conducted on different levels of teachers working in different states.
2. A study of burnout should be conducted in relation to monthly income of teachers and socio-economic-status of family members.
3. A study of burnout should be conducted in relation to teachers’ age and disciplines (arts, science and commerce).
4. A study should be replicated on the teachers teaching in mentally retarded schools, mentally handicapped schools, orthopedically handicapped schools, hearing impaired school and blind schools.
5. A study of burnout of teachers should be conducted in relation to people of different profession like architects, doctors, lawyers, patients and nurses etc.
