A Systematic Review And Research Agenda Of Internet Addiction Among Adolescents

Venu A.S,
PhD, Scholar, Srinivas University, Mangalore

Abstract:

Background: Internet addiction is very serious problem in today’s time among children and also among younger adults in India. It has become an important health and social issues in India. This review aimed to evaluate the prevalence of internet addiction among adolescents, factors responsible for internet addiction and its impact

Method: I searched following data base like PubMed, Medline, also through google scholar search engine and offline journals. Review included studies related to Prevalence of Internet addiction among adolescents, factors affecting internet addiction and studies related to Negative impact of internet addiction on Adolescents

Result: The result revealed that Prevalence of Internet addiction ranged from 0.4% to 50.8% among adolescents which was identified by using Youngs Internet addiction scale. Communication, accessing explicit material, and financial gains, accessing sex-oriented materials, and spending excessive time online, motivations for internet use, mental health, social skills, Environmental factors contribute to Internet addiction. Internet addiction had negative impact on physical health, psychological health and Academic performance

Conclusion: There is a need to conduct much more studies on internet addiction, need to develop preventive strategies on prevention of Internet addiction and conduct comparative studies among urban and rural adolescents

Introduction:

The internet is global linking of computers that allows information transfer. The Internet has made life a lot easier by making information more accessible to all and creating connections with different people around the world. However, it has also led a lot of people to spend too much time in front of the computer, so much so that it becomes the centre of their lives. This can lead to an Internet or computer addiction. The term “INTERNET ADDICTION” was proposed by Dr. Ivan Goldberg in 1996 for pathological compulsive internet use. Internet addiction is very serious problem in today’s time. Internet or computer addictions manifest in several ways that cover various degrees and areas of Internet usage. They are the following:

- Information overload. Too much online surfing leads to decreased productivity at work and fewer interactions with family members.
- Compulsions. Excessive time spent in online activities such as gaming, trading of stocks, gambling and even auctions often lead to overspending and problems at work.
- Cybersex addiction. Too much surfing of porn sites often affects real-life relationships.
- Cyber-relationship addiction. Excessive use of social networking sites to create relationships rather than spending time with family or friends may destroy real-life relationships.
Whenever Internet addicts feel overwhelmed, stressed, depressed, lonely or anxious, they use the Internet to seek solace and escape. Certain people are predisposed to having a computer or Internet addiction, such as those who suffer from anxiety and depression.

Their lack of emotional support means they turn to the Internet to fill this need. There are also those who have a history of other types of addiction, such as addictions to alcohol, drugs, sex and gambling. Even being stressed and unhappy can contribute greatly to the development of a computer or Internet addiction. People who are overly shy and cannot easily relate to their peers are also at a higher risk of developing a computer or Internet addiction.

An addiction to the Internet is manifested in both physical and emotional symptoms; however, these specifics may vary for each person. These are basically warning signals that an addiction may be developing.

The following symptoms are typical of online addicts:

- Feelings of guilt
- Anxiety
- Depression
- Dishonesty
- Euphoric feelings when in front of the computer
- Unable to keep schedules
- No sense of time
- Isolation
- Defensiveness
- Avoiding doing work
- Agitation

Physical Symptoms of Online Addiction.

The following symptoms are characteristic of someone who uses the computer for a very long period of time:

- Backache
- Headaches
- Weight gain or loss
- Disturbances in sleep
- Carpal tunnel syndrome
- Blurred or strained vision

The short-term effects of an online addiction include unfinished tasks, forgotten responsibilities and weight gain. Long-term effects are seen more in the physical symptoms such as backache, neck pain, carpal tunnel syndrome, and vision problems from staring at the screen. It can also lead to bankruptcy, especially if the time spent online is focused on shopping, gambling and gaming.

Objectives

The study was conducted to check out the following objectives

1. To review and analyze the published research studies on prevalence of internet addiction among adolescents
2. To review and analyze the published research studies on factors influencing internet addiction among adolescents
3. To review and analyze the published research studies on impact of internet addiction on the health of adolescents

Material and Methods

The study covered researches published in online and offline journals which were related to internet addiction of adolescents in India and abroad.

Internet addiction, factors affecting and impact of Internet addiction among adolescents and young adults. A total of 30 studies were reviewed out of which 10 studies are related to Prevalence of Internet addiction, 9 studies are related to factors affecting internet addiction and 11 studies related to impact of Internet addiction. Prevalence of Internet addiction was high among men Adolescents, addiction was mild to moderate (Arvind Sharma et.al(2014); Ikenna Adiele(2014); Deeksha Grover(2020); Ghassemzadeh L(2008); Ergin, A(2014); Şaşmaz, T(2012); Roberto Poli(2012); Shek, D. T. et.al(2016); Srijampana, V. V(2014); Siomos, K. E

Discussion:

A comprehensive systematic review of research studies was performed to review the empirical evidence on Internet addiction, factors affecting and impact of Internet addiction among adolescents and young adults. The results indicated that excessive internet usage leads to anxiety, depression, and adverse mental health, which affect their academic performance. Internet use has affected negatively on Academic performance, loss of sleep due to late night internet use affecting the attendance for morning activities. Majority expressed depression, moody and nervousness when offline. Internet addictive users spent significantly longer on the Internet. School problems, physical and mental health problems, and relationship problems were reported as being negative impacts of Internet use.
Following are the factors responsible for Internet addiction identified in the reviewed research studies: Time spent daily on Internet, Peer Influence, detached family, smoking habits, online shopping, seeing probe videos, Easy accessibility of Internet cafes, Exposure to internet gaming, online networking like twitter, psychiatric disorders, depression, Anxiety, Substance abuse were (Hassan, 2020; Krishnamurthy, 2015; Shar Salehi, M, 2014; Adiele, Ikenna & Olatokun, Wole, 2014; Comert, I. T, 2013; Ergin, A, 2013; Kuss, D. J, 2013;jourdib, Joseph et.al, 2021; de Ávila, G. B, 2020).

The negative impact of internet addiction was identified to be Anxiety, depression, Anxiety depression, Poor mental and physical health, physical complaints such as head ache, neck pain, feeling of stiffness, back ache, dry eyes, vision problem, decreased sleep quality, irregular bed time, use of tobacco, irregular dietary behavior leading to stunted growth and development, Interpersonal and work problem, poor School/Academic performance and relationship problems (Goel, D, 2013; Güzel, N, 2018; Wanajak, Kesaraporn, 2011; Yeonsoo Kim, 2010; Syed Shah Alam, 2010; Y. Zheng, D, 2016; Ah. Yusuf, 2020; Lebni, J. Y, 2020; Taha, M. H, 2019; Kesaraporn, 2011).

Research gap Identified:

1. The need for developing strategies for the prevention of internet addiction and therapeutic interventions for promoting healthy and safe use of the internet among adolescents in India
2. The investigation of the concordance between different screening measures for internet addiction and the determination of the prevalence of severe internet addiction among adolescents
3. The determination of the prevalence of internet addiction and its association with depression and negative self-perception among high school children
4. The determination of the prevalence of internet addiction and its association with depression and negative self-perception among high school children
5. The investigation of the relationship between sociodemographic characteristics, positive youth development, family processes, and internet addiction behavior among high school students
6. The exploration of the relationship between excessive internet use and mental health problems among Indian adolescents, including anxiety, depression, and poor mental and physical health scores
7. The assessment of negative impacts of internet use on school performance, physical and mental health, and relationships among adolescents
8. The investigation of the relationship between sociodemographic characteristics, positive youth development, family processes, and internet addiction behavior among high school students
9. The investigation of the association between psychiatric disorders (depression and substance use) and problematic internet use among Lebanese adolescents
10. A comparative study on Prevalence of Internet addiction among urban and rural Highschool students
11. A comparative study on Factors affecting Internet addiction among urban and rural high school students
12. A comparative study on Impact of Internet addiction among urban and rural Highschool students

Conclusion:

Based on the reviewed articles, it is evident that internet addiction is a prevalent issue among adolescents and young adults across different countries. Male adolescents tend to have a higher risk of internet addiction, and motivations such as communication, accessing explicit material, and financial gains, accessing sex-oriented materials, and spending excessive time online, motivations for internet use, mental health, social skills, Environmental factors contribute to Internet addiction. Internet addiction is associated with negative consequences such as lower self-esteem, poorer social skills, loneliness, and adverse mental health outcomes. Studies also highlighted the negative impact of Internet addiction on physical health, academic performance, and relationships.

Efforts should be made to develop preventive strategies, therapeutic interventions, and screening tools to identify and address internet addiction. Promoting healthy and safe internet use, as well as improving sociodemographic factors, positive youth development, and family processes, can help mitigate the risks associated with internet addiction. Reviews also suggest to conduct comparative studies in urban and rural adolescents.
