Abstract:The title compounds, $\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{BrNO}_{5} \mathrm{P}$ (I) and $\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{BrNO}_{5} \mathrm{P}$ (II) form a homologous series, the structures determinations confirm the nature of the products. The compounds all crystallize in Space group $C 2 / c$ for compound $I$ and $P$-lfor compound II. Differ by the presence of a Phosphonate atom instead of a dibutyl atom in the para position of two benzo atom of compound (II). Bond lengths and angles may be considered normal for these compound types. The dioxole rings in both structures similar planar conformations. Intra- and Intermolecular C-H...O and N-H...O hydrogen bonds are responsible for the consolidation of the crystal packing of both molecules. In addition to this, weak C-H... $\pi$ interactions are also observed.

Index Terms: single-crystal $X$-ray study; $T=296 \mathrm{~K}$; mean $(C-C)=0.006 A^{\circ} ; R$-factor $=0.0550$ in I and 0.0699 in II; wR factor $=0.1429$ in I and 0.1869 in II; data-to-parameter ratio 25.9.

## I. Introduction

In recent years, epidemiological studies confirmed the significant negative impact of infections caused by pathogenic bacteria and fungi against human health. Large-scale surveillance revealed increasing incidence of drug-resistance that had compromised the efficacy of antimicrobial therapy. The increased emergence of multidrug-resistant pathogenic bacteria has called for exploration of alternative drug therapies ${ }^{[1]}$. As such, research is now focused towards new antimicrobial agents with expansion of bioactivity of existing drugs and also with novel target so as to address the problem of resistance ${ }^{[2]}$.It has been long since researchers show special interest in heterocyclic compounds that possess sulphur and nitrogen atom ${ }^{[3,4]}$. Tiazole, for instance, exhibit widespread biological activities like antibacterial ${ }^{[5,6]}$, antimycobacterial ${ }^{[7]}$, antileishmanial ${ }^{[8]}$, anticancer ${ }^{[9]}$ and antifungal ${ }^{[10]}$.A similar co-ordination in hydrogen bonding, diethyl(5-chloro- 2 -hydroxyanilino)(4chlorophenyl)methyl]phosphonate has been reported by us ${ }^{[11]}$.

## II. Experimental

The diethyl (benzo[d][1,3]dioxol-5-yl((4-bromophenyl)amino)methyl)phosphonate compound $\quad \mathbf{I}\left(\mathrm{C}_{18} \mathrm{H}_{21} \mathrm{BrNO}_{5} \mathrm{P}\right)$ / dibutyl(benzo[d][1,3] dioxol-5-yl((4-bromophenyl)amino)methyl)phosphonatecompound $\quad \mathbf{I}\left(\mathrm{C}_{22} \mathrm{H}_{29} \mathrm{BrNO}_{5} \mathrm{P}\right)$ was prepared bytreating triethyl phosphite / tributylphosphite $(0.001 \mathrm{mmol})$ and N -(benzo[d][1,3]dioxol-5-ylchloromethyl)-4bromoaniline $(0.0015)$ intoluene at reflux temperature according to a previously reported method[16]. The chemical structure of the compound is shown in Figure 1.

Fig. 1 Chemical structure of compounds I and II

## III. Data collection

CryAlis Pro (Oxford Diffraction, 2007) ${ }^{[12]}$; cell refinement: CryAlis Pro; data reduction: CryAlis RED (Oxford Diffraction, 2007); program(s) used to solve structure: SHELXS86 (Sheldrick, 2008) ${ }^{[13]}$; program(s) used to refine structure: SHELXL97 (Sheldrick, 2008); molecular graphics: ZORTEPII (Zsolnai, 1997) ${ }^{[14]}$; software used to prepare material for publication: PARST (Nardelli, 1995) ${ }^{[15]}$.

## IV. Refinement

H atoms bonded to N and O atoms were located in a difference map and refined with distance restraints of $\mathrm{O}-\mathrm{H}=0.82$ and $\mathrm{N}-\mathrm{H}=0.86 \AA$, and with $\mathrm{U}_{\text {iso }}(\mathrm{H})=1.2 \mathrm{U}_{\mathrm{eq}}(\mathrm{N}, \mathrm{O})$. Other H -atoms bound to carbon were positioned geometrically and refined using a riding model with $\mathrm{d}(\mathrm{C}-\mathrm{H})=0.93 \AA \mathrm{U}_{\text {iso }}=1.2_{\mathrm{eq}}(\mathrm{C})$ for aromatic, $\mathrm{C}-\mathrm{H}=0.980 \AA \mathrm{U}_{\mathrm{iso}}=1.2_{\mathrm{eq}}(\mathrm{C})$ for methine, $0.97 \AA \mathrm{U}_{\text {iso }}=$ $1.2_{\mathrm{eq}}(\mathrm{C})$ for CH 2 group and $0.96 \AA \mathrm{U}_{\mathrm{iso}}=1.5_{\mathrm{eq}}(\mathrm{C})$ for CH 3 group.

## V. Structural Commentary

The structure determinations confirm the nature of the products compound I (Fig.1) and II (Fig.2). In both compounds, the bond angles for compound I, O2-P1-O4 and $\mathrm{O} 2-\mathrm{P} 1-\mathrm{O} 5$ are larger than $\mathrm{C} 5{ }^{\prime}-\mathrm{P} 1-\mathrm{O} 2$ and C 5 '- $\mathrm{P} 1-\mathrm{O} 4$ and compound II, O2-P2O 4 and $\mathrm{O} 2-\mathrm{P} 2-\mathrm{O} 5$ are larger than $\mathrm{C} 5^{\prime}-\mathrm{P} 2-\mathrm{O} 4$ and $\mathrm{C} 5^{\prime}-\mathrm{P} 2-\mathrm{O} 2$ bond angles indicate a distorted tetrahedral around the phosphorus atom. The $\mathrm{P}=\mathrm{O}$ bond length is a good agreement with related structures (Krishnai et al., 2009). TheP-O-C-C groups are in Trans configuration avoiding steric interactions. The compoundsC5'-P1-O5-C16group is nearly planar unlike the C5'-P2-O5-C18 group the end atoms C17-C19 are completely out of plane due to more thermal vibrations. The dihedral angles between the dioxole ring and the almost planar di-methyl-amino-methyl (r.m.s deviation $=0.042 \AA$ ). 1,3benzdioxole fragment is nearly planar [the maximum deviation being $0.057 \AA$. The planar benzene rings are nearly perpendicular to each with dihedral angle of $78.1(1)^{\circ}$. In both compounds, the bromophenyl ring system (C1-C6) is essentially planar with maximum deviations of $0.026(1) \AA$ and $0.016(1) \AA$ for atom Br in compound I and II, respectively. The mean planes of the dioxole ring system make dihedral angles of $2.1(1)^{\circ}, 19.0(1)^{\circ}$ and $33.9(1)^{\circ}$ respectively, in compound I and $0.7(1)^{\circ}, 38.1(2)^{\circ}$ and $87.6(2)^{\circ}$ respectively, in compound II. In both compounds, the tetrahedral configuration is distorted around the atom P1 and P2. The increase in the O4-P1-O5 and O4-P2-

O5 angle [120.0(1) $)^{\circ}$ in I and 119.9(2) ${ }^{\circ}$ in II], with simultaneous decrease in the C5'-P1-O2 and C5 ${ }^{\prime}-\mathrm{P} 2-\mathrm{O} 2$ angle $\left[108.5(1)^{\circ}\right.$ in I and $107.6(1)^{\circ}$ in II], from the ideal tetrahedral value $(109.5)^{\circ}$ are attributed to the Thorpe-Ingold effect (Bassindale, 1984). The widening of the angles may be due to the repulsive interaction between the two short $\mathrm{P}=\mathrm{O}$ bonds.

## VI. Superamolecular features

In compounds I, the molecules are held together by an intermolecular interactions of the types N1-H1_. O 2 and C8H8...O5 (Table 2), enclosing an $\mathrm{R}^{2}{ }_{2}(10)$ closed ring motif, propagating along the [101] direction (Figs. 4 and 5). Fig. 6 packing of the molecule in the unit cell, viewed down 'a'-axis. In compounds II, the molecules are held together by an intermolecular interactions of the types $\mathrm{N} 1-\mathrm{H} 1 \ldots \mathrm{O} 2$ and $\mathrm{C} 13-\mathrm{H} 13 \ldots \mathrm{O} 2$ (Table 2), enclosing an $\mathrm{R}^{2}{ }_{2}(12)$ closed ring motif, propagating along the [101] direction (Figs. 7 and 8). Fig. 9 packing of the molecule in the unit cell, viewed down 'c'-axis. The C-H...O intermolecular hydrogen bonds, acts as a bridge between N-H...O intermolecular bonds, intra and intermolecular N-H...O hydrogen bonds. Here the phosphonate double bonded oxygen atom, which behaves as an acceptor participates in $\mathrm{C}-\mathrm{H} . . \mathrm{O}$ intermolecular hydrogen bonding, whereas, the hydroxyl oxygen, which acts as both donor and acceptor, participates in the N-H...O intra and intermolecular hydrogen bonding. The hydrogen bond forms chains along [010].

In the crystal of I, weak $\pi \ldots \pi$ interactions are present $\mathrm{Cg} 2-\mathrm{Cg} 3=3.766(2) \AA$ where Cg 2 and Cg 3 are the centroids of rings (C1-C6) and (C7-C13) respectively. Symmetry code:[ 1-x,2-y,1-z]. No significant intermolecular interactions or C-H... $\pi$ interactions with centroid distances of less than $4 \AA$ are observed in the structure.
