# AUTOMOBILE POPULATION GROWTH IN INDIA AN ANALYSIS ACROSS SELECT STATES 

${ }^{1}$ M.Mohamed Ishaq, ${ }^{2}$ Dr.A.Sulthan Mohideen<br>Assistant Professor of Commerce, Hajee Karutha Rowther Howdia College, Autonomous, (‘A’Grade) Uthamapalayam-625 533 Theni District (TN)

#### Abstract

This paper titled 'AUTOMOBILE POPULATION GROWTH IN INDIA- AN ANALYSIS ACROSS SELECT STATES', makes an attempt to highlight the increase or growth of number of automobilesin India. In this study, the numbers of vehicles registered in 12 select States and the Union Territory of New Delhi have beentaken for a 15- year period from 2001 to 2015 and the data on the number of vehicles registered in various States and New Delhi have been collected from theRoad Transport Year Book (2013-14 and 2014-15) released by the Ministry of Road Transport \& Highways Transport Research Wing and made available on the website: www.morth.nic.in.and another website: www.data.gov.in was also referred to for the collection of necessary data. The statistical tools Percentages, Range, Standard Deviation, Co-efficient of Variation, Compound Growth Rate(CGR), Average Annual Growth Rate(AAR), Growth Index(GI) and Skewness have been applied to analyze the data.

## Introduction

Eversince man began to live as civilized societies, he began to invent many things to make his life easier and add comforts to his everyday life. His inventions have paved the way for the growth and development of theeconomy of nations. The Invention of motorized vehicles(Automobiles)is not a mean achievement of human, since it enabled the man to augment his personal mobility and his goods by means of automobiles called as 'TRANSPORTATION'. Now, the transportation has become the world order in so far as the infrastructure and development of a nation is concerned irrespective of its economic strata, size, location or any other things.Further, the activities pertaining to automobiles production and utilization have also created innumerable job opportunities to both the skilled and unskilled labourers. Thus,the transportation, more specifically the means of transportation is not matter to be done away with. Today, the motorized vehicles suiting the various needs of diverse users are manufactured throughout the world in the names of commercial, non-commercial, sports vehicles, two-wheelers and threewheelers etc. and the Sub-continent is not an exemption to this common phenomenon. In India vehicles of all kinds are manufactured and made available for the aspirants by a number of automobile manufacturers.

## Road Transportation - Indian Scenario

In India, among the all modes of transportation, the road transportation is more dominant both in terms of number of passenger traffic and movements of goods as well as its contribution to the national economy. It is preferred over the other types of transports because of its easy accessibility, flexibility of operations, reliability and upto-the- point service. The modes of road transports consist of commercial and non-commercial vehicles, motor cycles and three-wheelers. Presently, as in the other parts of the world,India is also witnessing large scale urbanization and mobility of people from rural to urban areas, consequently, the need for expanding the transportation facilities has become imperative for social, cultural and economic integration. Hence, the State Governments and the Union Government are taking many steps in providing adequate road facilities for the movement of automobiles.

Before Liberalization of the Indian economy in 1992, the people of India had limited options to purchase automobiles. But with the liberalization and the growth of Indian economy many world-renowned automobile manufacturers began to realize the India's automobile market potentiality. The high population, large scale transportation of goods, more disposable income of the people, greater urban mobility, the aspiration of the people for leisure travel, easy loans offered by banks and non-banking finance companies, nearness to the service centres and above all the middle class people's desire to own their personal transportation mode and the improvement in the highway infrastructure have resulted in the enormous increase in the automobile population surpassing population growth. In a research paper by B. Sudhakara Reddy and P. Balachandra ${ }^{1}{ }^{i t}$ is pointed out that the number of vehicles in a 25- year period between 1981 and 2005, the vehicle population in India has increased by about 15 times from 5.36 to 81.5 million vehicles, whereas, the population during the same period has increased by 1.7 times.

## An Overview of the Previous Studies

Due to urbanization the increase in transport demand, hampered by resource constraints, has widened the gap between demand and supply (Srinivasan et al. 2007). The primary problem is not the increase in number of vehicles but, rather, their high

[^0]concentration in a few densely populated metropolitan areas. In $2001,32 \%$ of all vehicles were in such cities, though these places constitute only $11 \%$ of India's urban population (Ministry of Urban Development 2008). Motorizations in urban India is growing faster than the population; automobile ownership growth rates are of the order of $15-20 \%$ per annum in most cities (Indiastat.com, 2008).In calculating the car ownership pattern from 2001 to 2009 Dash et al. (2013) identified that the ownership levels of four-wheelers has doubled from 6.59 per 1,000 people to 12.68 . Though the growth of vehicle acquisition has raised many concerns, its growth indicates the desire of the middle-class to lead more comfortable lives (Shirgaokar et al. 2012). Relativelylow per-capita incomes also makes car ownership as a symbol of luxury and status. (Dissanayake and Morikawa 2002). The automobile seems to be the dominant transportation mode choice with at least $85 \%$ of the total share of all journey-tothe office (Schafer, 1998). In India, the share of public transportation peaks among people living in the megapolis regions, where the supply networks and systems are appropriate (World Bank, 2002).

## Objectives

The study is conducted with following objectives:

1. To highlight the automobile population growth in India and in select states.
2. To ascertain the shares of the select states in India's total automobile population.
3. To identify the position of select states in terms of automobile population and on statistical parameters.
4. To estimate the automobile population growth rates.

## Key Words:

1. Select States - The 12 States and the Union Territory of New Delhi, in which the number of automobiles registered, is considered for analysis.
2. Other States: The States and the Union Territories other than the selected 12 states and the Union Territory of New Delhi.
3. Automobiles: Motorized vehicles used for commercial and commercial purposes.
4. Automobile Population: The number of automobiles.
5. Density: The number of automobiles per 1000 people.

## Methodology

The study is purely based on the secondary data available on the websites www.morth.nic.in.and www.data.gov.in. The number of automobiles registered in all the Indian states and the Union Territories are available on the mentioned websites. But the data pertaining to 12 States and the Union Territory of New Delhi alone were taken for the analysis as these states, demarcated as select states, account for nearly $85 \%$ of the total automobiles registrations in India. The number of vehicles registered in each year is for the year ending $31{ }^{\text {st }}$ March.

The collected data were statistically analyzed so as to draw inferences based on the objectives of the study. The statistical tools the percentage method, estimation of trends by OLS method, Range, Standard Deviation, Coefficient of Variation, Growth Rates and Skewness have been applied. The Co-efficient of Variation is calculated by the formula

Three types of Growth Rates viz., Compound Growth Rate (CGR), Average Annual Growth Rate(AAR) and Average Growth Index(AGI) were also estimated by applying the following formulae.

1. Compound Growth Rate $(\mathrm{CGR})=(\text { Antilog } \mathrm{b}-1)^{*} 100$

The value of ' $b$ ' is obtained in estimating the Linear Growth Curve
2. Annual Growth Rate $(\mathrm{AGR})=\frac{\text { Value of }(\mathrm{n}+1) \text { th year }- \text { Value of }(\mathrm{n}) \text { th year })}{\text { Value of }(\mathrm{n}) \text { th year })} \times 100$

Annual Growth Rate (AGR)is the yearly variation in percentages. In this method the current year's value is taken as the base and assumed to be equal to 100 percent. The change in the value in the subsequent year is estimated as a proportion to the current year's value. The AGR is estimated from the first year upto the penultimate year. The AGR for last year cannot be calculated as the value for the year after the last year is not available. The AGR obtained by applying this formula for each of the select state is added and its mean value is calculated which is termed, herein, as the Average Annual Growth Rate.

Another method of measuring the growth rate is the Growth Index. The Growth Index is calculated by applying the formula
3. Growth Index (GI): $\frac{\text { Value of (n)th year ) }}{\text { Value of the first year }} \times 100$

In this formula the first year's value is taken as equal to 100 and the remaining years' values are expressed as a proportion to the first year's value. The values so obtained for each of the select state are summedand the average of this sum is the Annual Growth Index.

The total number of vehicles registered in the select states and other states and all India's total during the study period are presented in Table -1

|  | e：Compute <br> Resu | on the basis $s$ and Dis | Table： 6 <br> ssions： |  |  |  | or |  |  |  |  |

Table－1 shows that during the period of study all the select states posted an increase in the number of automobiles，with Maharashtra recording the highest number of automobiles population growth with $21,52,14,000$ vehicles followed by Tamil Nadu，Uttar Pradesh，Gujarat and Andhra Pradesh in that order．The least number of registration is associated with West Bengal with $5,29,34,000$ automobiles．During the same period the number of automobiles registration in states other than the select states stood at $22,62,48,000$ ．The table also reveals that the numbers of automobiles registered in all the states are increasing on annual basis but Karnataka in 2007，West Bengal in 2008 and 2009 and New Delhi in 2005 indicated a slight decline in the number of automobiles registration．

The percentage of automobiles registered in each of the select state to the total number of automobiles registration in India is presented in Table－2．The observation of the figures leads us to conclude that the state of Maharashtra holds the highest percentage of automobile registrations in all the years of the study period．This state is followed by Gujarat in the first couple of years of study period and in the subsequent years by Tamil Nadu．The lowest percentage of registration is shown by West Bengal． The year－wise comparison of each state reveals that Andhra Pradesh in 2006，Gujarat in 2002，Haryana in 2009，Karnataka in 2014，Kerala，Rajasthan，Uttar Pradesh and West Bengal in 2015，Madhya Pradesh，Punjab and New Delhi in 2001，Maharashtra in 2002，Tamil Nadu in 2003 have had the highest percentage of automobiles registration in the study period．The percentage of automobiles registration in the rest of the states almost remains same with slight variations in subsequent years．Table -3 ，showing the ranks of the states on the basis of percentage of automobiles registration，also discloses the same information as by Table 2. However it can be observed that Haryana and West Bengal shared the twelfth position in 2004，similarly Andhra Pradesh and Karnataka in 2013 and 2014 shared the fifth position．

The annual increase in the number of automobiles registration in the states is available in Table．－4．The annual increase is the increase in the number of automobiles registered in the current year over the previous year＇snumber of registrations．If the highest increase in any state in any year of the study period is considered，Uttar Pradesh marked the highest increase in the year 2015 with 25，21，000 automobiles and the states of Tamil Nadu in 2003，West Bengal in 2013，Andhra Pradesh in 2007，

Maharashtra in 2015, Karnataka in 2010, respectively follow Uttar Pradesh in that phenomenon. The number of automobiles registration continues unchanged in the last three years in Punjab, and that has declined in Andhra Pradesh, Karnataka in 2007, New Delhi in 2005 and in West Bengal in 2008 and 2010. Except these states, all states have displayed increases in number of number of automobiles registration.

The trend values for the number of automobiles registered is calculated by Ordinary Least Square (OLS) method and shown in Table-5. The OLS method categorically states the tendency of the observed values. The Trend Value for any year is calculated with the formula

Trend: $\mathrm{Y}=\mathrm{a}+\mathrm{bx}$, Where ' Y ' is the calculated trend value: ' a ' is constant: ' b ' is the intercept and x is the value for the year as the difference between the base year and the year under consideration. The Table of trend values shows the calculated trend values for the number of automobiles registration in the period of study. Since the number of automobiles registration is on the increase barring negligible decrease in some states in some years, the calculated trend values are on the increase.

The data were analyzed by applying select statistical tools and the values of the results, so obtained, are presented in Table-6. The ranks assigned to the select states on the basis of statistical parameters along with the automobile density are available in Table-7. The table shows that Maharashtra and Tamil Nadu hold the first two positions (except the second rank held by Gujarat in Minimum) in so far as the Total, Mean, Maximum, Range, Standard Deviation and Average Annual Growth Index (AAGI) are considered. Even so, these two states' coefficient of variation is not the least but the coefficient of variation of either West Bengal or Punjab is the least. West Bengal clutches the first position in the Average Annual Growth Rate (AAGR) and the highest Compound Growth Rate (GCR) occurs for the values pertaining to Karnataka. The factor automobile density (Number of automobiles per 1000 people) highlights that the Union Territory of New Delhi and the states of Tamil Nadu and Gujarat occupy the top three rungs of the automobile density ladder with 424,326 and 300 automobiles respectively and the last three (11 to 13) ranks are positioned with Madhya Pradesh, Uttar Pradesh and West Bengal with 144,100 and 80 automobiles respectively. The Maharashtra state, which ranks first place in total number of automobiles registration, the percentage of automobiles registered and in some statistical parameters slips to $8^{\text {th }}$ position in automobile density with 215 automobiles.

## Conclusion:

The automobile sector enables large scale personal mobility, consequently it makes a remarkablechanges in the society by bringing lots of benefits to the people. The fact that the automobile sales in urban India is growing faster than the population with 15 to $20 \%$ per annum (Indiastat.com, 2008) is a positive sign of economic development. With the launch of several automobile manufacturing units throughout the nation, many regions have become the automobile hub and, thereby, created large scale employment opportunities. In this paper an attempt has made to highlight the growth of automobile population across select states, their position in the automobile population registrations and growth. The analysis shows that the states of Maharashtra, Tamil Nadu, Gujarat, Uttar Pradesh, Andhra Pradesh and Karnataka occupy the top slots in the number of automobile registrations and these states also play key position in the statistical parameters. In so far as the density of automobiles is considered the Union Territory of New Delhi is ranked number 1 followed by Tamil Nadu.

The increased use of automobiles also causes some other problems like air pollution, road congestion and road accidents, health related problems and the large scale out-go of Indian money for importing crude oil. So it may suggested that strict implementation of traffic rules and lane discipline, effective and updated petroleum conservation measures and increasing the public transport system will play a no less role in ensuring the significance and effectiveness of the automobile sector in Subcontinent.
